Revised:
October 2025

PREFACE

The Engineering Department is committed to providing a high quality of life by ensuring properly designed and constructed infrastructure for those who work and reside in the City of McAllen. The condition of streets, sidewalks, driveways, storm drainage, water, and sanitary sewer facilities play an integral part in the everyday life of motorists and pedestrians. By responsibly designing, constructing and maintaining quality infrastructure, the City of McAllen reduces its financial burden from personal injuries and damage to property caused by premature failure of facilities.

This document was prepared to assist planners, designers, engineers and architects during the development of infrastructure improvements in public rights of way by standardizing design criteria.

NOTE: This document will be reviewed and revised as necessary in order to adapt to the dynamic nature of infrastructure improvements as well as reflect advances and innovations in standard design practices. It is the responsibility of the user to obtain the most recent revision.

Copies of this standard are available via the City of McAllen Website at <http://www.mcallen.net>.

Introduction

This document has been prepared to standardize design requirements for streets, storm drainage, water and sanitary sewer facilities that are primarily constructed as part of residential and commercial subdivisions.

This document is intended to serve as a design guide for planners, designers, engineers and architects involved in the preparation of plans and specifications, which will be submitted for construction within the City of McAllen.

The ultimate goals of this design guide are to:

1. Maintain a high standard for improvements within public rights of way.
2. Maximize the integrity of public facilities.
3. Maximize the protection of motorists and pedestrians.
4. Minimize inconvenience to pedestrians, motoring traffic and landowners adjacent to public rights of way.
5. Minimize the future maintenance cost to the City.

[Back to Table of Contents](#)

Pavement Design

Flexible Pavements

The following design criteria shall be applicable to the noted street width. Additional details are noted in Appendix III.

Characteristic	Street Classification			
	Local	Collector	Minor Arterial	Principal Arterial
Street Width (Measured from back of curb to back of curb, B-B)	32' B-B to 40' B-B ⁴	40' B-B ⁴ to 44' B-B	52' B-B to 65' B-B	65' B-B and Greater
Minimum Structural Section				
Subgrade ¹	6 inches	6 inches	12 inches	12 inches
Flexible Base ²	8 inches	10 inches	12 inches	12 inches
Hot Mix Asphaltic Concrete ³ (HMAC)	2 inches	2.5 inches	3 inches	3 inches
Min. transverse slope	2 %	2%	2.5%	2.5%
Min. longitudinal slope	0.20 %	0.20%	0.20%	0.20%
Min. width of curb and gutter	24 inches	24 inches	24 inches	24 inches

1. Subgrade shall be compacted to 95% maximum dry density, as determined by the standard proctor (ASTM D698), and treated with lime at an applicable rate if the plasticity index of the soils is greater than 20. All compacted subgrade shall extend to a minimum of 1 foot behind the proposed back of curb.
2. The flexible base shall be compacted to 95% maximum dry density, as determined by the standard proctor (ASTM D698), and treated with lime at an applicable rate if the plasticity index of the soils is greater than 12. All compacted flexible base shall extend to a minimum of 1 foot behind the proposed back of curb.
3. All hot mix asphaltic concrete shall consist of Type "D", crushed limestone aggregate and be compacted to 95% of the maximum theoretical dry density.
4. 40' B-B may be designated as a local or collector street depending on the streets function.

If an alternate pavement section is requested, a pavement design analysis will be required for approval by the City Engineer or designee. A minimum 30-year period shall be utilized for all designs.

Concrete Pavement

Concrete pavements sections for all widths shall be designed utilizing the following criteria:

1. Thickness designs for Concrete Highways and Street Pavement, Portland Cement Association, EB109P, Reprinted 1995

2. Concrete Streets: Typical Pavement Sections and Jointing Details, Portland Cement Association, IS211P, 1980
3. Design and Construction of Joints for Concrete Streets, Portland Cement Association, IS061P, 1992
4. Construction Specification Guideline for Concrete Streets and Local Roads, Portland Cement Association, IS119P, 1998
5. Guide Specifications for Concrete Curbs and Combined Curbs and Gutters, Portland Cement Association, IS110P, 1983
6. A minimum 30-year period shall be utilized for all designs

Alley Design

In all new subdivisions containing alleys, the developer shall construct alleys in accordance with the engineering requirements of the City.

ROW	20 feet
Paving width	16 feet
<u>Minimum Structural Section:</u>	
Subgrade	6 inches
Flexible Base	8 inches
HMAC	2 inches

Additional details are noted in Appendix III. If an alternate pavement section is requested, a pavement design analysis will be required for approval by the City Engineer or designee. A minimum 30-year period shall be utilized for all designs.

Sidewalk Design

The following design criteria shall be applicable to sidewalk designs. Additional details are noted in Appendix III.

1. Sidewalk alignment shall be set at the back of curb. Deviation is permitted to match existing alignment when connecting to existing sidewalk. Any other deviation shall require approval from the City Engineer.
2. Sidewalk shall slope toward the street with a maximum transverse slope of ¼ inch per foot (2%) and a maximum longitudinal slope of ½ inch per foot (5%). Runoff from the sidewalk shall be directed towards the street gutter.
3. Sidewalk shall be 5-foot minimum width when placed adjacent to the curb. When aligned towards an existing offset sidewalk that, it may be reduced to 4 feet to match the existing sidewalk. Sidewalks within State ROW are a minimum of 5 feet in width.

[Back to Table of Contents](#)

4. Sidewalks and ramps shall be constructed of 4" thick concrete reinforced with 6" x 6" No. 6 gage wire mesh or No. 3 bars @ 8" O.C.E.W.
5. Bar-lift Plastic Chairs, or approved equal, shall be used to secure steel at center of concrete thickness
6. Subgrade shall be compacted to 90% standard proctor.
7. Minimum 3-inch sand backfill required.
8. Contraction joints shall be scored every 6 feet and expansion joints every 30 feet.
9. Sidewalk shall have a broom finish transverse to the walkway. When exposed aggregate, pavers, tile and/or colored concrete are proposed within the right of way, approval of the pattern and finish is required from the Engineering Department prior to construction.
10. All concrete shall be 5-sack concrete and shall have a minimum compressive strength of 3000 psi.
11. Membrane curing compound shall be applied at a minimum of 1 gallon per 180 square feet of area.
12. Ramps shall be placed at all intersection with roadways or where required by law / City. Curb and gutter must be saw cut.
13. Flatwork is required to meet Texas Accessibility Standards (Texas Civil Statutes, Article 9102).
14. Any admixtures to the concrete mix (i.e. fiber mesh, plasticizers, etc.) shall require approval.

Driveway Apron Design

The following design criteria shall be applicable to residential driveway apron designs. Additional details are noted in Appendix III.

1. Driveway widths:
 - Residential minimum is 12 ft. and maximum is 25 ft.
 - Commercial minimum is 25 ft and maximum is 45 ft.
2. Curb cut must be a minimum of 6-feet from a side property line.
3. Flow line of new gutter shall match existing flow line.
4. Curb and gutter must be saw cut.
5. Driveway aprons shall be constructed of concrete with a minimum of 6 inches in thickness, reinforced with 6" x 6" No. 6 wire mesh, No. 3 bars @ 12" O.C.E.W. or No. 4 bars @ 18" O.C.E.W.

[Back to Table of Contents](#)

6. Bar-lift Plastic Chairs, or approved equal, shall be used to secure steel at center of concrete thickness.
7. Concrete shall have a broom finish. When exposed aggregate, pavers, tile and/or colored concrete are proposed within the right of way, approval of the pattern and finish is required from the Engineering Department prior to construction.
8. All concrete shall be 5-sack concrete and shall have a minimum compressive strength of 3000 psi.
9. Membrane curing compound shall be applied at a minimum of 1 gallon per 180 square feet of area.
10. Subgrade shall be compacted to 95% standard proctor for commercial driveways and 90% standard proctor for residential driveways.
11. Expansion joint required at property line and intersection with sidewalks. Longitudinal expansion joint required at mid-point of driveway if width is greater than 18 feet
12. Longitudinal sawed contraction joint required at 15 ft minimum.
13. If a manhole falls within a driveway pad, the manhole lid shall be placed flush with the elevation of the driveway.
14. Any driveway placed where a drainage bar ditch exists, shall maintain the flow line of the ditch with the placement of a concrete culvert.
15. Driveway wings shall not exceed a 12:1 slope.
16. Any admixtures to the concrete mix (i.e. fiber mesh, plasticizers, etc.) shall require approval.

[Back to Table of Contents](#)

Drainage Design

All storm drainage designs shall comply with the City of McAllen Drainage Policy as noted in Appendix I and detailed in Appendix IV. The following is a general summary of the requirements:

1. Calculation of the 10-year storm pre-development runoff is required to be submitted to the City Engineer.
2. Calculation of the 50-year storm post development runoff to be detained on-site, shall be submitted to the City Engineer.
3. Scaled maps showing the drainage basins used in the above calculations will need to be submitted to the City Engineer for review and approval.
4. On-site detention methods shall include ponds or engineered sub-surface systems. Acceptable methods of supplemental detention shall be reviewed and approved by the City Engineer.
5. Drainage outfalls must flow and/or detain a 50-year storm (i.e. Blueline Ditch).
6. Inlet spacing shall not exceed 600 feet, with a maximum surface run of 300 feet from the crest to sag of the roadway profile. In the event the longitudinal slope of the roadway is required to exceed 300 feet, inlets shall still be spaced at 300 feet maximum. Minimum slopes for drainage pipes shall be determined utilizing a design velocity of 3 feet per second.
7. Sites shall be graded in such a manner as to provide positive drainage but shall not adversely affect adjacent drainage patterns. The rear of residential lots shall slope with a minimum 1% slope to the front. A subdivision lot grading plan shall be provided by the subdivision Engineer prior to issuance of any permits for construction of subdivision improvements.
8. Final grades along the perimeter of the proposed subdivision that are above or below the adjacent property elevation may require installation of a retaining wall. Properties shall be graded to drain away from the grade differential.
9. Storm sewer lines shall require gravel bedding of six (6) inches minimum and gravel backfill to the spring line of the reinforced concrete pipe. The remaining trench depth shall be mechanically compacted in one (1) foot lifts to 95% of the maximum dry density as defined by the standard proctor.
10. As part of the as built plans all inlets and manholes shall be surveyed by an RPLS. Survey shall include northing and easting coordinates of the inlet and manhole centerline and elevations of tops and inverts referenced to the City of McAllen benchmark grid.

Traffic Control Design

The Traffic Control Policy applies to the implementation of all traffic control devices placed within the jurisdiction of the City of McAllen. Any variances of this policy are subject to approval by the City Engineer or designee.

Traffic Signs

1. 'Sign & Markings' plan is required as part of the construction plans.
2. Developer is responsible for installation of all 'Stop', 'Speed Limit', 'Street Name', and 'Warning' signs within the right-of-way in the bounds of new developments.
3. All traffic signs shall conform to the *Texas Manual on Uniform Traffic Control Devices* as well as the City of McAllen's 'Sign Material Standards', 'Sign Installation Details', and 'Sign Location Standards'.

Pavement Markings

1. 'Sign & Markings' plan is required as part of the construction plans.
2. Pavement markings placed on any street within the jurisdiction of the City of McAllen shall conform to the *Texas Manual on Uniform Traffic Control Devices* as well as the City of McAllen's 'Pavement Marking Standards'.
3. Pavement markings shall be installed on streets that meet the *Texas Manual on Uniform Traffic Control Devices* pavement markings warrants or as deemed necessary by the City Engineer or designee.

Temporary Traffic Control

1. A traffic control plan shall be included as part of all construction plans, right of way permits, and special event applications.
2. All temporary traffic control within the City of McAllen's jurisdiction shall conform to the *Texas Manual on Traffic Control Devices* as well as the provisions of this policy including construction work zones, maintenance operations, utility operations, loading and unloading operations, planned road closures, as well as special event traffic control.

References

1. Introduction

This policy shall govern the planning, design, construction and operation of storm drainage facilities within the City of McAllen and its extraterritorial jurisdiction. Any variances to this policy are subject to approval by the City Engineer and/or City Commission.

The design guidelines presented in this policy were prepared to facilitate the design, review and construction of proposed drainage infrastructure improvements. The methodologies appearing in the following sections are consistent with standard engineering practice and are intended to serve as guidance in the design of related infrastructure. Interpretation, implementation and engineering judgment shall be the responsibility of the engineer of record.

[Back to Table of Contents](#)

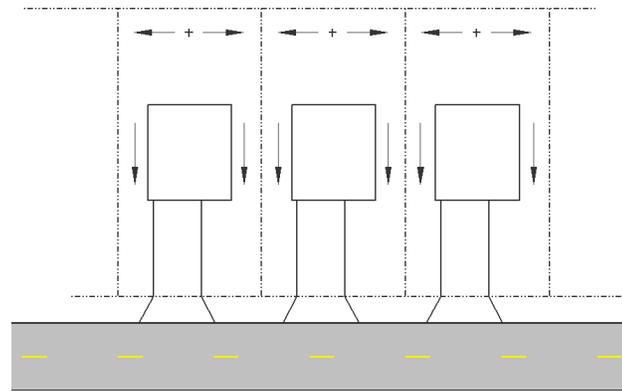

2. General

The following summary presents general drainage policy guidelines. Additional detail may be found in subsequent sections.

- A. This Drainage Policy shall apply to all drainage improvements within the limits of the City of McAllen (City) and its Extraterritorial Jurisdiction (ETJ). When a conflict in design arises with applicable criteria (Hidalgo County Drainage District No. 1, Texas Department of Transportation, etc.) the more restrictive criteria shall govern.
- B. All drainage reports and plans shall be prepared by a Licensed Professional Engineer holding a valid license to practice in the State of Texas.
- C. All proposed development within the City and its ETJ shall require a storm sewer outfall designated in accordance with the Master Drainage Plan.
- D. In instances where proposed drainage infrastructure improvements require conveyance to an outfall, the developer shall be responsible for design of the conveyance to accommodate storm water runoff from fully developed conditions within the entire subject drainage basin and all reasonable interconnects. The City may consider a cost share or reimbursement program for costs associated with the construction of the offsite conveyance.
- E. All storm sewer conduit and related appurtenances maintained by the City of McAllen shall be located within City right-of-way and/or dedicated drainage easements.
- F. All drainage facilities including street gutters, inlets, pipes and related appurtenances to the drainage outfall system shall be designed to intercept and convey runoff from a 10- year frequency storm event and checked for a 25-year frequency storm event.
- G. The drainage outfall system ("Blue Lines") shall be designed to convey and/or detain storm water runoff from a 50-year frequency storm. The developer must comply with regulations to attain approval for connection to a drainage outfall system through a jurisdictional entity.
- H. Improvements which will increase the frequency of flooding or the depth of inundation of unprotected structures in the 100-year flood plain or areas of flooding shall not be permitted for construction. The developer must comply with City Ordinance Subpart B "Land Use Regulations and Related Activities" Chapter 118 Floods.
- I. Off-site discharge for post development conditions shall not exceed the pre-development peak discharge for all storm events up to and including the 10-year storm event.
- J. Stormwater runoff generated from developed improvements shall be detained on-site for a 50-year frequency storm event and released into the receiving system at the pre- developed, peak discharge rate for a 10-year frequency storm event.

[Back to Table of Contents](#)

- K. For redevelopments that have no existing detention, the pre-developed peak discharge rate shall include land cover prior to any development on site.
- L. For master planned developments, stormwater detention requirements shall be reassessed if land use is changed such that calculations show increase in runoff when compared to original approval.
- M. Residential lots shall be graded to provide positive drainage towards the front of the lot at a minimum slope of 1%.

Typical Lot Grading

- N. In no instance shall site grading on residential or commercial properties adversely affect neighboring properties.
- O. In the event of a difference in grade between adjacent properties, each property shall be graded to drain away from the deviation. Grade differentials in excess of 1-foot shall require an engineered retaining structure.
- P. Construction activity shall not interfere with the normal operation of existing drainage systems.
- Q. Storm drainage designs shall account for off-site drainage patterns affected by any proposed drainage improvements.
- R. Variances from procedures described in this policy shall require approval from the City Engineer and/or City Commission, as applicable.
- S. All formulas and factors appearing in this policy are presented in English units unless noted otherwise.

[Back to Table of Contents](#)

2.1 Minimum Requirements for Drainage Reports and Plans

The drainage report and plans, as applicable, shall contain the minimum information described below:

A. Reports

1. Summary of project location, existing/proposed conditions Location map
2. Location of proposed site with respect to FEMA Floodplain Drainage Area Map
3. All contributing areas delineated
4. Contours
5. Spot elevations
6. Direction of flow
7. Right-of-way, property lines
8. Existing/proposed storm sewer systems; outfalls
9. Design assumptions
10. Runoff, detention and hydraulic calculation summary
11. Time of concentration estimates
12. Runoff coefficient assumptions
13. Storage volume calculations
14. Pipe and inlet capacities
15. Ponded widths and depths
16. Inlet capacities and bypass
17. Hydraulic Grade Line (HGL)

B. Storm Sewer Plan and Profile Plan

1. Right-of-way/property lines
2. Storm sewer alignment
3. Direction of flow
4. High points
5. Identification of existing and proposed storm sewer
6. Identification of existing and proposed storm sewer inlets, manholes, and junctions
7. Profile
8. Pipe length, size, class, and slope
9. Identification of inlets, manholes, junction boxes
10. Flow lines at structures, outfalls; 100-foot intervals along storm sewer length
11. Finished grade/natural ground
12. Utility crossings, conflicts
13. Hydraulic Grade Line (10-year)
14. Top of curb elevations
15. Manhole rim elevations
16. Trench protection limits
17. Applicable details (other than standard)

C. Bridge/Culvert Layouts

1. Plan and Profile
2. Hydraulic calculations
3. Applicable details

D. Channels and Detention Basins

1. Grading plan/Earthwork
2. Calculations
3. Typical Sections
4. Hydraulic calculations
4. Design water surface elevations
5. Maintenance access
6. Applicable details

3.0 Stormwater Runoff

3.1 Rational Method

Peak flows may be estimated with use of the Rational Method for areas less than 100-acres.

$$Q = CiA$$

where:

Q = flow (cubic feet/second)

i = intensity (inches/hour)

A = Area (acres)

For areas greater than 100-acres, including phased projects with total area greater than 100 acres, SCS Unit Hydrograph (Ty III rainfall distribution) methodology shall be utilized. In addition, applicable hydrologic software(s) may be utilized with approval from the City Engineer.

3.2 Rainfall and Intensity

Intensity calculations shall utilize Intensity-Duration-Frequency coefficients for Hidalgo County, Texas as presented in Table 3-1 below:

Recurrence Interval (years)	IDF Coefficients		
	e	B	d
2	0.831	74	9.6
5	0.795	80	9.2
10	0.778	87	9.2
25	0.771	98	9.2
50	0.749	99	9.2
100	0.740	103	9.6

Reference: TxDOT *Intensity-Frequency-Duration Coefficients for Texas Counties* HDM (2004)

Table 3-1: Intensity-Frequency-Duration Coefficients for Hidalgo County, Texas

Intensity can be calculated by the relationship presented below.

$$i = b/(t_c + d)^e$$

where:

i = intensity (inches/hour)

t_c = time of concentration (minutes)

3.3 Time of Concentration

Time of concentration may be estimated by considering the velocity associated with three typical flow regimes; overland/sheet flow, shallow concentrated flow and pipe or channel flow. Time of concentration shall be calculated for each applicable flow regime encountered.

$$t_c = L / 60V$$

where:

t_c = travel time (minutes)

L = watercourse length (feet)

V = average flow velocity (feet/second)

3.4 Velocity Estimates

Velocities for overland/sheet flow and shallow concentrated flow may be estimated with the following relationship.

$$V = K_u k S_P^{1/2}$$

where:

$K_u = 3.28$

V = velocity (feet / second)

k = intercept coefficient

S_P = slope (%)

Land Cover / Flow Regime	k
Forest with heavy ground litter; hay meadow (overland flow)	0.076
Trash fallow or minimum tillage cultivation; contour or strip cropped; woodland (overland flow)	0.152
Short grass pasture (overland flow)	0.213
Cultivated straight row (overland flow)	0.274
Nearly bare and untilled (overland flow); alluvial fans in western mountain regions	0.305
Grassed waterway (shallow concentrated flow)	0.457
Unpaved (shallow concentrated flow)	0.491
Paved area (shallow concentrated flow); small upland gullies	0.619

Table 3-2: Intercept Coefficients

Manning's Equation shall be used to estimate average flow velocities in channels and conduits.

$$V = 1.49/n R^{2/3} S^{1/2}$$

Stormwater runoff shall be calculated for fully developed conditions. Minimum inlet time of concentration shall be 10-minutes.

3.5 Drainage Areas

Drainage areas shall be delineated with the aid of available topographic information. Care should be taken when considering existing drainage systems that cross natural drainage divides.

For areas greater than 100-acres, including phased projects with total area greater than 100 acres, SCS Unit Hydrograph (Ty III rainfall distribution) methodology shall be utilized. In addition, applicable hydrologic software(s) may be utilized with approval from the City Engineer.

3.6 Runoff Coefficients

Runoff coefficients shall be determined for each drainage area. Where non-homogeneous conditions exist, a weighted coefficient shall be determined with application of the following formula:

$$C_W = (C_1A_1 + C_2A_2 + C_3A_3 + \dots + C_nA_n) / A_{Total}$$

where:

C_W = Weighted Runoff Coefficient

C_n = Runoff Coefficient n-th term

A_n = Area of n-th term (acres)

A_{Total} = Total Area (acres)

Table 3-3 presents typical ranges for "C". Runoff coefficients utilized for 25-year and 50-year storm frequencies shall be adjusted by 10% and 20%, respectively.

Type of Drainage Area	Runoff Coefficient, C
Business	
Downtown areas	0.70 - 0.95
Neighborhood areas	0.50 - 0.70
Residential:	
Single-family areas	0.30 - 0.50
Multi-units, detached	0.40 - 0.60
Multi-units, attached	0.60 - 0.75
Suburban	0.25 - 0.40
Apartment dwelling areas	0.50 - 0.70
Industrial:	
Light areas	0.50 - 0.80
Heavy areas	0.60 - 0.90
Parks, cemeteries	0.10 - 0.25
Playgrounds	0.20 - 0.40
Railroad yard areas	0.20 - 0.40
Unimproved areas	0.10 - 0.30
Lawns:	
Sandy soil, flat, 2%	0.05 - 0.10
Sandy soil, average, 2 - 7%	0.10 - 0.15
Sandy soil, steep, 7%	0.15 - 0.20
Heavy soil, flat, 2%	0.13 - 0.17
Heavy soil, average, 2 - 7%	0.18 - 0.22
Heavy soil, steep, 7%	0.25 - 0.35
Streets:	
Asphaltic	0.70 - 0.95
Concrete	0.80 - 0.95
Brick	0.70 - 0.85
Drives and walks	0.75 - 0.85
Roofs	0.75 - 0.95
Reference: FHWA, <i>Urban Drainage Design Manual</i> HEC-22, (2001)	

Table 3-3: Runoff Coefficients

In order to assist designers, a flow rate determination table is included in Appendix A.

[Back to Table of Contents](#)

4.0 Street Flow

To maintain safe passage of vehicular and pedestrian traffic and to ensure properties are kept reasonably safe from flooding, the designer shall be responsible for determining the depth and width of stormwater runoff. Calculated ponding widths and depths shall be presented on storm sewer plan sheets.

The width of spread on a pavement section shall be contained to provide passage of vehicular traffic as specified in Table 4-1 below.

Functional Classification	Clear Lanes
Local	(a)
Collector	1 - 11 foot
Minor Arterial	2 - 11 foot (1 each way)
Principal Arterial	2 - 11 foot (1 each way)
(a) No width requirement; depth not to exceed top of curb	

Table 4-1: Spread Limits for Roadways

In all cases, depth of flow shall be maintained at or below top of curb. For inlets located at sag points, the designer shall consider the effects resulting depths on existing and/or proposed adjacent grades.

Flow in a gutter section can be calculated with adaptation of Manning's Equation.⁽¹⁾

$$Q = (K_U/n) S_X^{1.67} S_L^{0.5} T^{2.67}$$

Spread width can be determined by the formula

$$T = (Q_n / K_U S_X^{1.67} S_L^{0.5})^{0.375}$$

where:

$K_U = 0.56$

N = Manning's roughness coefficient

Q = flow (cubic feet / second)

T = spread width (feet)

S_X = cross slope (foot / foot)

S_L = longitudinal slope (foot / foot)

Table 4.2 presents acceptable values of Manning's roughness coefficient.

Type of Gutter or Pavement	Manning's n
Concrete gutter, troweled finish	0.012
Asphalt Pavement	
Smooth Texture	0.013
Rough Texture	0.016
Concrete gutter-asphalt pavement	
Smooth	0.013
Rough	0.015
Concrete Pavement	
Float finish	0.014
Broom finish	0.016
For gutters with small slope, where sediment may accumulate, increase above values of "n" by	0.002
Reference: FHWA, <i>Design Charts for Open Channel Flow</i> HDS-3 (1961)	

Table 4-2: Manning's Roughness Coefficient, n

Depth of flow in a gutter section can be calculated by the formula

$$D = TS_x$$

Where:

D = depth of flow (feet)

T = spread width (feet)

S_x = cross slope (foot / foot)

The above formulas are applicable for pavement sections with a uniform, straight cross slope. The designer is referred to consult Reference 1 in Appendix A when composite pavement sections or parabolic crowns are encountered.

[Back to Table of Contents](#)

5.0 Inlet Design

Curb and grate inlets shall be used to facilitate the drainage of pavement sections and open areas. Placement of inlets shall consider the safety of pedestrian, vehicular and bicycle traffic. Inlets shall be placed at low points and at intervals necessary to meet maximum permissible spread limits and inlet capacities. In any case, inlet spacing shall not exceed 600-feet, with a maximum surface run of 300-feet from crest to sag of the roadway profile. In the event a longitudinal roadway profile exceeds 300-feet from crest to sag, inlets shall be spaced at a maximum of 300- feet. Flows shall be intercepted upstream of street intersections where practical.

Runoff across roadway intersections consisting of a minor or principal arterial street is prohibited. For inlets on grade, by-pass flows shall be limited to 10% of previously intercepted flows. When curb inlet extensions are required, no more than two extensions shall be used conjunction with a primary inlet. Inlet hydraulics shall be presented on plan sheets. The use of inlets other than curb-opening or grate inlets shall require approval from the CityEngineer.

5.1 Curb Inlet Capacity

Capacities for inlets may be determined by the following equations.

A. Curb Opening Inlets on Grade

$$L_T = K_U Q^{0.42} S_L^{0.3} (1/n S_X)$$

where:

L_T = curb opening length for 100% interception (feet)

K_U = 0.6

Q = flow in gutter (cubic feet/second)

S_L = longitudinal slope (foot/foot)

n = Manning's roughness coefficient

S_X = cross slope (foot/foot)

B. Curb Inlets on Grade with Depressed Curb Opening

$$L_T = K_U Q^{0.42} S_L^{0.3} (1/n S_e)$$

In this case the cross slope, S_X is replaced by an equivalent cross slope, S_e that accounts for the depressed gutter section. The equivalent cross slope is calculated by

$$S_e = S_X + S'_w E_o$$

where:

S_e = equivalent cross slope (foot / foot)

S_X = pavement cross slope (foot / foot)

S'_w = gutter cross slope; gutter depression/gutter width (foot / foot)

E_o = ratio of flow in depressed section to total gutter flow upstream of inlet

[Back to Table of Contents](#)

C. Curb Inlets - Sag Location

Curb opening inlets operate under weir or orifice flow conditions.

1. Weir Condition - Capacity of a curb opening inlet under weir conditions can be estimated by the following relationship.

$$Q_I = C_W (L + 1.8W) d^{1.5}$$

Where:

$$C_W = 2.3$$

L = length of curb opening (feet)

W = lateral width of depression (feet)

d = depth at curb measured from normal cross slope (feet)

This formula is applicable for depths less than the curb opening plus the depth of the depression.

where:

h = curb opening height (feet)

a = depth of depression (inches)

or

$$d \leq h + a/12$$

2. Orifice Condition – Curb openings act as orifices at depths greater than approximately 1.4 times the opening heights. The capacity can be computed using the following relationship:

$$Q_I = C_O h L (2g d_o)^{0.5}$$

Or

$$Q_I = C_O A_g [2g (d_l - h/2)]^{0.5}$$

where:

$C_O = 0.67$ (orifice coefficient)

d_o = head on center of orifice throat (feet)

L = length of orifice opening (feet)

A_g = clear area of opening (square feet)

d_l = depth at lip of curb opening (feet)

h = height of curb opening orifice (feet)

For curb opening inlet other than vertical face use:

$$d_o = d_i - (h/2)\sin\theta$$

h = orifice throat width (feet)

d_o = effective head on center of orifice throat (feet)

5.2 Grate Inlet Capacity

A. Grate Inlets in Sag Locations – Inlets may be calculated as weir or orifice flow.

1. Weir flow may be calculated using the following relationship:

$$Q_I = C_w P d^{1.5}$$

where:

P = perimeter of the grate (feet) disregarding curb side

C_w = 3.0

d = average depth across grate (feet)

2. As an orifice, flow may be calculated using the following relationship.

$$Q_I = C_o A_g (2gd)^{0.5}$$

where:

C_o = 0.67 (orifice coefficient)

A_g = clear opening area of grate (square feet)

g = 32.2 (feet/second/second)

3. Grate inlet design shall incorporate a 50% factor to account for clogging.

B. When the use or analysis of combination inlets is required, the designer shall consult Reference 1 in Appendix A.

6.0 Storm Sewer Design

6.1 Design Considerations

Storm sewer systems shall be designed to convey runoff from a 10-year frequency storm event and checked for a 25-year frequency storm event. Storm sewer systems shall utilize rubber-gasketed, Class III reinforced concrete pipe (RCP) with a minimum size of 24 inches. Manholes or junction boxes shall be utilized at all changes in pipe size and direction in both horizontal and vertical planes. Manhole spacing shall be maintained as presented in Table 6.1.

Pipe Size (inches)	Maximum Spacing (feet)
12 to 24	300
27 to 36	400
42 to 54	500
60 and greater	1000
Reference: FHWA, <i>Urban Sewerage Design Manual</i> HEC-22 (2001)	

Table 6-1: Suggested Manhole Spacing⁽¹⁾

Pipes shall be matched at soffits when practical. In instances where radial alignment is required, pipe joints shall not be deflected beyond manufacturer's suggested tolerances. Pipe slopes shall be designed to provide a minimum velocity of 3-feet per second and a maximum velocity of 12-feet per second. Table 6-2 on page 2 presents the minimum slopes necessary to achieve the minimum velocity.

Diameter (inches)	Slope (foot/foot)	Slope (%)
24	0.00174	0.174
27	0.00148	0.148
30	0.00129	0.129
36	0.00101	0.101
42	0.00082	0.082
48	0.00069	0.069
54	0.00059	0.059
60	0.00051	0.051
66	0.00045	0.045
72	0.00040	0.040
Based on Manning's Equation; $v = 3$ fps, $n = 0.013$		

Table 6-2: Minimum Pipe Slopes

All outfalls shall incorporate the use of a concrete sloped-end treatment as per the City of McAllen standard drainage detail. Where outlet velocities exceed maximums, velocity dissipation shall be required.

Minimum depth of cover for all storm sewer pipe shall be 3-feet from finished grade to the crown of the pipe. Depth of cover not meeting this requirement shall require structural calculations as approved by the City Engineer.

Trench protection shall be required for storm sewer system installations exceeding depths of 5-feet.

6.2 Hydraulic Grade Line Analysis

A hydraulic grade line (HGL) analysis is required for all proposed storm sewer system improvements.

The analysis shall include determination and presentation of the 10-year HGL. The HGL shall be shown on all storm sewer profile plans. The hydraulic grade line shall be maintained at or below the throat of the inlet. Computations shall include determination of major and minor losses.

Starting water surface elevations shall be calculated from the best available data. The designer shall document all assumptions. For starting water surface elevations where an outfall is provided at a channel, a backwater analysis shall be utilized where no water surface data is available. Similarly, starting water surface elevations at ties to existing storm sewer systems shall utilize best available data and shall be reviewed and approved by the City Engineer.

A. Major Losses due to friction may be calculated by the relationship:

$$H_f = S_f L$$

where:

H_f = loss due to friction (feet)

S_f = friction slope (feet)

L = length of conduit (feet)

$$S_f = (Qn / K_Q D^{2.67})^2$$

Q = flow (cubic feet/second)

n = Manning's roughness coefficient

$K_Q = 0.46$

D = pipe diameter (feet)

Manning's roughness coefficient may be assumed as 0.013 for concrete pipe.

B. Minor Losses result from flow disturbances at junctions such as inlets, manholes or junction boxes. Minor losses may be calculated with application of the formula

$$H_m = K (V^2/2g)$$

where:

H_m = minor losses (feet)

K = constant of proportionality

V = velocity (feet / second)

g = gravitational acceleration constant (32.2 feet/second/second)

$$K = K_O C_D C_d C_Q C_p C_B$$

K = constant of proportionality

K_O = initial head loss coefficient based on relative access hole size

C_D = correction factor for pipe diameter (pressure flow only)

C_d = correction factor for flow depth

C_Q = correction factor for relative depth

C_p = correction factor for plunging flow

C_B = correction factor for benching

Relative Manhole size, K_O

This is estimated as a function of the relative structure size and angle of deflection between the inflow and outflow pipe.

$$K_O = 0.1(b/D_O)(1-\sin\theta) + 1.4(b/D_O)^{0.15}\sin\theta$$

θ = angle between pipes (degrees)

b = manhole/junction diameter (feet)

D_O = diameter of outlet pipe

Pipe Diameter, C_D

A change in head loss due to differences in pipe diameter is only significant in pressure flow situation where the depth in the structure to outlet pipe diameter ratio (depth/ D_O) is greater than 3.2, otherwise C_D is set to equal to 1.0.

$$C_D = (D_O/D_I)^3$$

D_O = diameter of outlet pipe

D_I = diameter of incoming pipe

Flow Depth, C_d

This formula is applicable in cases of free surface flow or low pressures where depth/ D_o is less than 3.2, otherwise C_d is equal to 1.0. Depth in the access hole is estimated as HGL at upstream end of outlet pipe.

$$C_d = 0.5 (d_{mh}/D_o)^{0.6}$$

d_{mh} = depth in mh/junction

D_o = diameter of outlet pipe

Relative Flow, C_Q

This formula is applied when 3 or more pipes enter the structure at approximately the same elevation, otherwise C_Q is equal to 1.0.

$$C_Q = (1-2 \sin\theta)(1-Q_i/Q_o)^{0.75} + 1$$

where:

θ = angle between pipes

Q_i = flow in incoming pipe

Q_o = flow in outgoing pipe

Plunging Flow, C_p

This corresponds to the effect of another inflow pipe or surface flow from an inlet, plunging into the structure, on the inflow pipe for which the head loss is being calculated. It is applicable if $h > d_{mh}$ and if the plunging flow is at a higher elevation and inflow and outflow pipes are at the bottom of the manhole / junction. This correction factor is also applied at curb and grate inlets functioning as junctions.

$$C_p = 1 + 0.2 (h/D_o) ((h-d_{mh})/D_o)$$

where:

h = elevation difference between the invert of plunging flow pipe to center of outflow pipe

D_o = outlet pipe diameter

d_{mh} = depth of water in manhole relative to outlet pipe invert

[Back to Table of Contents](#)

Benching, C_B

The correction factor is applied to address benching configurations for either submerged or unsubmerged conditions.

Bench Type	C_B	
	Submerged ⁽¹⁾	Unsubmerged ⁽²⁾
Flat or Depressed Floor	1.00	1.00
Half Bench	0.95	0.15
Full Bench	0.75	0.07
(1) pressure flow $d_{mh}/D_o \geq 3.2$ (2) free surface flow $d_{mh}/D_o \leq 1.0$ Reference: FHWA, <i>Urban Sewerage Design Manual</i> HEC-22 (2001)		

Table 6.3: Bench correction factor, C_B

C. Exit Losses

Exit losses shall be accounted for at all outfalls.

$$H_E = 1.0 (V_o^2/2g - V_r^2/2g)$$

where:

V_o = average velocity at outlet (feet / second)

V_r = velocity of receiving stream (feet / second)

- D. All hydrologic and hydraulic design computations may be completed with the aid of design software approved by the City Engineer.

[Back to Table of Contents](#)

7.0 Detention Design

7.1 Design Considerations

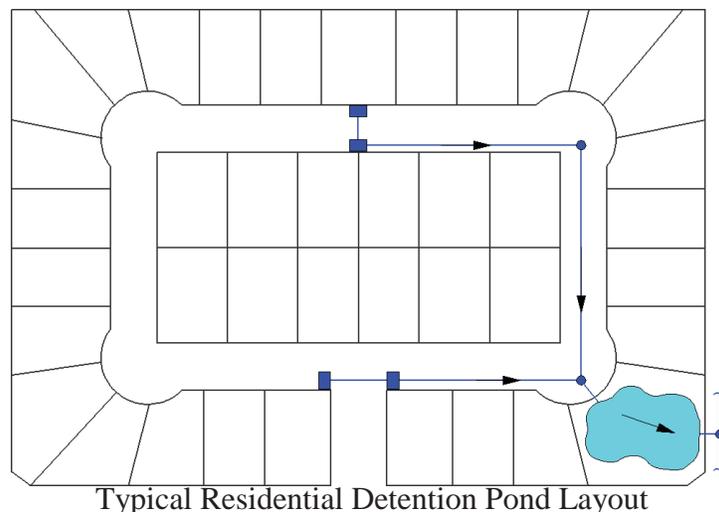

Stormwater runoff generated from developed improvements shall be detained on-site for a 50-year frequency storm event and released into the receiving system at the pre-developed rate for a 10-year frequency storm event. The Modified Rational Method (MRM) shall be used to determine stormwater storage requirements for areas less than 10-acres. For areas greater than 10-acres, the MRM may be used to estimate storage requirements. However, final detention design shall implement appropriate hydrograph routing procedures that account for the storage characteristics of the basin and discharge characteristics of the outlet structure. Applicable software programs may be implemented with approval from the City Engineer.

Existing drainage facilities (i.e. City of McAllen Bluelines, Regional Stormwater Detention Facilities, etc.) shall not take the place of dedicated facilities unless previously included in the City of McAllen's Master Drainage Plan.

Methods of on-site detention shall include ponds or engineered sub-surface systems with an outlet structure connecting into an approved drainage system. Detention pond areas shall be vegetated to prevent erosion and deposition of silts. Common Bermuda, Winter Rye or a combination of the grasses may be used. Vegetated areas shall include provisions for irrigation systems. Detention areas may be incorporated into landscape and greenbelt areas if vegetation does not adversely affect required design volumes or impede hydraulic efficiency. Areas designated as dual use areas (detention/landscape, detention/green space, etc.) shall display appropriate signage indicating so.

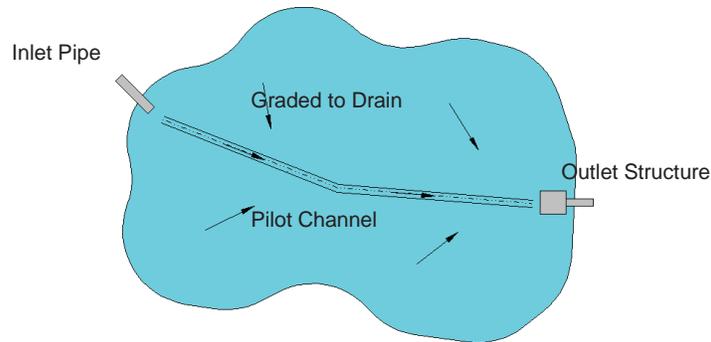

Maintenance of detention areas shall be the responsibility of the property owner's or home owner's association as applicable. The City shall have the authority to assume the responsibility of maintaining the detention areas and impose applicable fees in the event the property owner or home owner's association fails to comply with the maintenance requirements.

On-site detention facilities shall be situated in dedicated areas.

Typical Residential Detention Pond Layout

Side slopes shall not exceed 3:1 (H:V). Detention pond depths at or exceeding 2.5-feet shall require a safety buffer in the form of benching or 4 ft tall fencing around the perimeter of the pond.

Typical Dry Stormwater Detention Pond

The bottom of the basin shall be graded to drain towards the outlet structure. A pilot channel shall be placed along the flow line from inlet to outlet to ensure positive flow.

Trash racks shall be incorporated into outlet structure design.

A minimum width of 6-feet shall be maintained around the perimeter of the pond to allow for routine maintenance and/or repair. Detention area design shall consider proximity and elevation of adjacent building structures. Bank areas shall be graded to drain away from such structures.

No freeboard above design pool elevation shall be required, however, the design of detention areas shall incorporate diversion of overflows into street rights-of-way or drainage/flowage easements in the event of an extreme event or outlet structure failure.

For single family residential developments with 5 lots or less, detention storage may be achieved within shallow swales along the perimeter of the lot. Shallow swale side slopes shall not exceed 2:1. Storm water runoff may be conveyed via storm sewer networks, flumes and curb cuts within the lot. The bottom of swale shall be graded to drain towards the outlet structure to an approved drainage system.

7.2 Modified Rational Method

The Modified Rational Method may be used to estimate storage volumes. The MRM produces a trapezoidal runoff hydrograph based on the Rational formula. Storage requirements are based upon differences in volume between pre and post development runoff hydrographs for various storm durations. Calculations are best carried out in tabular form.

(A)	(B)	(C)	(D)	(E)	(F)	(G)
Duration	Intensity	Q_{in}	Vol_{in}	Q_{out}	V_{out}	Storage
(min)	(in/hr)	(cfs)	(ft ³)	(cfs)	(ft ³)	(ft ³)

Column A: Duration in minutes

Column B: Intensity for respective duration (50-year event)

Column C: Developed conditions peak discharge ($C_{dev} \times i_{50} \times Area$)

Column D: Developed conditions Runoff Volume ($Q_{in} \times Duration \times 60$)

Column E: Pre-developed peak discharge ($C_{pre} \times i_{10} \times Area$)

Column F: ($0.5 \times [duration + t_{c\ dev}] \times Q_{out} \times 60$)

Column G: Required storage ($V_{in} - V_{out}$)

The calculations are carried out iteratively until a duration yielding the greatest storage volume is achieved. The following example illustrates application of the MRM.

[Back to Table of Contents](#)

7.3 Modified Rational Method Example

Site Area: 5.3-acres

Pre-developed Conditions

C = 0.25
 $t_c = 60$ min
 $i_{10} = 3.22$ in/hr
 $Q_{peak} = 4.27$ cfs

Post-developed Conditions

C = 0.60
 $t_c = 20$ min
 $i_{50} = 7.91$ in/hr
 $Q_{peak} = 30.18$ cfs

Duration (min)	Intensity (in/hr)	Q_{in} (cfs)	V_{in} (ft ³)	Q_{out} (cfs)	V_{out} (ft ³)	Storage (ft ³)
10	10.83	41.31	24,786	4.27	3,840	20,945
20	7.91	30.18	36,212	4.27	5,121	31,092
30	6.34	24.20	43,566	4.27	6,401	37,165
40	5.35	20.42	48,997	4.27	7,681	41,317
50	4.66	17.77	53,321	4.27	8,961	44,360
60	4.14	15.81	56,925	4.27	10,241	46,684
70	3.75	14.29	60,027	4.27	11,521	48,506
80	3.43	13.07	62,757	4.27	12,801	49,956
90	3.16	12.07	65,200	4.27	14,081	51,119
100	2.94	11.24	67,416	4.27	15,362	52,055
110	2.76	10.52	69,447	4.27	16,642	52,806
120	2.60	9.91	71,325	4.27	17,922	53,403
130	2.45	9.37	73,072	4.27	19,202	53,870
140	2.33	8.89	74,708	4.27	20,482	54,226
150	2.22	8.47	76,248	4.27	21,762	54,486
160	2.12	8.09	77,704	4.27	23,042	54,662
170	2.03	7.75	79,085	4.27	24,322	54,762
180	1.95	7.44	80,400	4.27	25,603	54,797
190	1.88	7.16	81,655	4.27	26,883	54,772
200	1.81	6.90	82,856	4.27	28,163	54,693
210	1.75	6.67	84,009	4.27	29,443	54,566
220	1.69	6.45	85,117	4.27	30,723	54,394

Required storage = 54,797 ft³ = 1.25 ac-ft with a controlled release of 4.27 cfs.

[Back to Table of Contents](#)

8.0 Channel Design

City maintained/dedicated Channels shall be designed to convey and or detain stormwater runoff resulting from the 50-year storm. Typical channel sections shall incorporate maximum side slopes of 3:1 (H:V). Side slopes shall be vegetated to prevent erosion and degradation of slopes.

- A. Utility crossings within the banks of a channel are discouraged. In instances where such crossings are unavoidable, utilities shall be designed to maximize the cross-sectional area of the channel in the vicinity of crossing. Utility crossings shall be protected from floating debris and scour.
- B. Water surface profiles shall be prepared utilizing standard-step backwater calculations or hydraulic modeling software such as HEC-RAS. Calculations shall account for losses at bridge and culvert crossings.
- C. Typical channel sections shall incorporate the use of a pilot channel with a minimum 10-foot maintenance bench on either side (12' preferred). Maintenance benches shall be graded to slope toward the pilot channel at a minimum slope of 12:1 (H:V). Access to maintenance benches shall be provided at end sections of the channel at grades not exceeding 5%.
- D. Culverts shall be sized to convey the 50-year storm and shall be designed in accordance with criteria as specified in Chapter 8 of the Texas Department of Transportation Hydraulic Design Manual.⁽⁵⁾

SOLID WASTE COLLECTION CONSTRUCTION GUIDELINES

Purpose

The purpose of these guidelines is to ensure the public's health / welfare and compliance with the City of McAllen to provide assistance in the proper design and installation of facilities consistent with solid waste disposal policies and ordinance. All guidelines are subject to periodic revision.

The City of McAllen Recycling Center enables our community to be more sustainable through recycling practices. Our purpose is to divert waste from reaching landfills, reduce costly disposal fees for our city and preserve our environment.

Why We Recycle

Waste reduction and recycling efforts can make a difference, but it's on us individuals to do our part. While issues like global warming, loss of rain forests, hazardous waste, and our waste disposal crisis may seem like an escalating issue recycling can counter act it. Recycling can have a positive impact on our natural environment as it can help reduce the pollution caused by waste. Recycling requires less energy and can help preserve natural resources.

Solid Waste Ordinance

The purpose of our chapter 90 Solid Waste Ordinance is to provide and establish a method or system of collecting and disposing of garbage or trash, recyclables, brush, and all waste originating in the city, to provide and establish reasonable rules and regulations pertaining thereto, and to establish reasonable, fair, uniform and equitable charges for the services of the city in collecting and removing garbage or trash, recyclables and brush all in order to protect the health and welfare of the citizens of the city and the general public.

In business, commercial, industrial or multifamily premises, dumpsters are required and provided by the city and, unless otherwise authorized by the public works director or designee. If a customer's premises is adjacent and accessible to an alley, the customer shall place for collection the garbage or trash and recyclables containers adjacent to the property in the approved portion of the alley right-of-way where it may be easily accessible to the person collecting and removing garbage or trash and recyclables. If it is not practicable to collect and remove the garbage or trash and recyclables containers from an alley, or if there is no alley, the customer shall place the containers for service at such point on the property as the public works director or designee shall assign and designate as the most convenient and accessible for collecting and removing. The public works director or designee is hereby authorized, based on field conditions, to determine whether or not a dumpster shall be required for collection of garbage or trash or recycles from the premises referred to in this section. If the public works director deems that a dumpster should be used for any apartment, duplex, triplex, quads, condominium or townhouse, then such container shall be utilized for collection of garbage and trash and recyclables at such location. (Apartments, duplexes, triplexes, quads, condominiums and townhouses). At a minimum, a multifamily complex shall be determined to require one two-cubic-yard dumpster serviced twice per week per ten unit or fraction thereof. Dumpsters are required for collection of garbage or trash from mobile home and travel trailer parks.

[Back to Table of Contents](#)

Residential- Single Family

A single family home is an independent residential structure that sits on a piece of land and is designed to be a single dwelling unit. They can be fully detached, semi-detached or side-by-side. Each unit must also meet the below criteria:

- Be separated by a ground-to roof wall,
- Have a separate heating system,
- Have individual meters for public utilities, and
- Have no units located above or below.

The “roll-out” garbage bins available are 96 gallons in volume and are assigned as such:

- A black one for garbage
- A blue one for recycling.

**Please visit Appendix A for reference on the standards for “roll-out” bin placement on the streets, as it may impact the subdivision design.*

1. Lot Width Requirements:

- 40 Feet may be set forth by the municipality to allow efficient placement of waste collection containers and access for waste collection vehicles.
- Consider the placement of the waste collection area during the design phase to ensure easy accessibility and minimal disruption to the residents.

2. Maneuvering Standards for Collection Vehicles:

- Ensure that the turning radius for residential areas accommodates waste collection vehicles, allowing them to maneuver safely and efficiently within the community.
- Trucks involved in waste collection will require a turning radius of 45 feet to enter alleys or service drives for proper trash collection.
- The City of McAllen requires that trucks be able to exit streets or service drives by driving forward. If this is not feasible, the approach must be designed to minimize backing situations, with a maximum of 100 feet backing in a straight line allowed.
- A height clearance of 20 feet must be maintained, free of any obstructions, to allow for overhead collection by waste management vehicles.
- Plan the street design to facilitate waste collection vehicle access to all residential properties without causing congestion or hindering the overall traffic flow.
- Coordinate with waste management authorities to ensure that the road design and turning radius align with the specific requirements for waste collection vehicles as mandated by the City of McAllen.
- Corner clips may be required for residential subdivisions where egress and ingress to alleyways can restrict turning radius of waste collection trucks.
- **Please visit Appendix B for reference on the maneuvering standards, and Appendix E for reference on waste collection vehicles*

3. Cul-De-Sac Radius Specifications:

- Design cul-de-sacs with a minimum outside paved radius of 50 feet to face of curb to ensure that waste collection vehicles can navigate smoothly and collect waste from adjacent properties without difficulty.
- Ensure that the cul-de-sac design permits waste collection vehicles to enter and exit the area without maneuvering challenges.
- **Please visit Appendix C for reference on the cul-de-sac details*

4. Submission of Plat to Planning Department (No Site Plan Required):

- Developers/engineers must submit the plat of the residential (single family) construction project to the Planning Department for review and approval.
- A detailed plat indicating the layout of the residential community, including the designated waste collection areas and access points, should be submitted for assessment.

[Back to Table of Contents](#)

MultiFamily

(Apartments or condos with greater than 5 units) – Residential buildings containing units built one on top of another and those built side-by-side which do not have a ground-to-roof wall and/or have common facilities.

Alleyways/service drives are required for this type of development, with the use of commercial dumpsters for efficient solid waste collection.

The typical practice is to have enclosures to help confine discards and appear more attractive in the subdivision. There are several configurations that can be proposed to locate them near parking areas or in corners of the subdivision to enable residents the ability to dispose of the garbage or recyclables while going to their car or when they make their way out of the subdivision. These locations of enclosures also help reduce the possibility of illegal dumping by non-residents.

1. Alley/Service Drive Requirements:

- Incorporate alleyways/service drives in the design plan to allow for safe access for waste collection vehicles.
- Ensure that the alleyways meet the minimum width requirement as mandated by the municipality to accommodate waste collection vehicles.

2. Dumpster Easements Adjacent to Alleyways:

- Allocate adequate space for dumpsters adjacent to alleyways to facilitate efficient waste disposal and collection for multifamily units.
- Obtain necessary easements for dumpsters in alley streets to ensure that dumpsters can be placed in predetermined areas without the possibility of obstructions by utilities.
- ***Please visit Appendix F for reference on the dumpster enclosure details**

3. Maneuvering Standards for Collection Vehicles:

- Ensure that the turning radius for residential areas accommodates waste collection vehicles, allowing them to maneuver safely and efficiently within the community.
- Trucks involved in waste collection will require a turning radius of 45 feet to enter alleys or service drives for proper trash collection.
- The City of McAllen requires that trucks be able to exit streets or service drives by driving forward. If this is not feasible, the approach must be designed to minimize backing situations, with a maximum of 100 feet backing in a straight line allowed.
- A height clearance of 20 feet must be maintained, free of any obstructions, to allow for overhead collection by waste management vehicles.
- Plan the street design to facilitate waste collection vehicle access to all multifamily properties without causing congestion or hindering the overall traffic flow.
- Coordinate with waste management authorities to ensure that the road design and turning radius align with the specific requirements for waste collection vehicles as mandated by the City of McAllen.
- Corner clips may be required for multifamily subdivisions where egress and ingress to alleyways can restrict turning radius of waste collection trucks.
- ***Please visit Appendix B for reference on the maneuvering standards, and Appendix E for reference on waste collection vehicles**

4. Cul-De-Sacs:

- If cul-de-sacs are present within the multifamily residential area, ensure they are designed to accommodate waste collection vehicles for ease of navigation and waste pickup.
- **Design cul-de-sacs with a minimum outside paved radius of 50 feet to the face of curb to ensure that waste collection vehicles can navigate smoothly and collect waste from adjacent properties without difficulty.**
- ***Please visit Appendix C for reference on the cul-de-sac details**

5. Submission of Plat to Planning Department :

- Prior to the commencement of construction, developers/engineers must submit the subdivision plat to the Planning Department for review and approval.
- The submitted documents should include detailed provisions for waste management, including the location of dumpsters, alleyways, and any other waste collection infrastructure.
 - Site Plan may be required when constructing a Planned Unit Development, otherwise the only the plat is sufficient.
- Dumpster enclosures may be required to be built at time of subdivision as deemed necessary.

6. Route 98

- In developments where the City of McAllen water utility services are not present, the current owner of the property must set up a "Sanitation Only" Account with the City of McAllen. This service account must be set up with the Customer Relations department before final inspections can be approved.

[Back to Table of Contents](#)

Townhomes

Alleyways/service drives are required for this type of development, with the use of commercial dumpsters for efficient solid waste collection.

These developments may need to have centralized solid waste collection areas as this may be more convenient for the drivers if the appropriate spacing requirements aren't met for residential curb collection. This may also help reduce congestion and be more efficient for residents.

1. Alleys/Service Drives and Dumpster Enclosures:

- Alleys/service drives must be constructed for townhome developments to facilitate the use of dumpsters for solid waste collection.
- Ensure that the alleyways meet the minimum width requirement as mandated by the municipality to accommodate waste collection vehicles.
- Enclosures must be built for dumpsters to ensure secure and organized waste disposal and to comply with the municipality's buffer standards.
- ***Please visit Appendix F for reference on the dumpster enclosure details**
- They alley requirement may be waived if the lot width is 40 feet or more. If this is the case, solid waste collection will be conducted via black and blue bins provided by the municipal solid waste department.
 - The "roll-out" garbage bins available are 96 gallons in volume and are assigned as such:
 - A black one for garbage
 - A blue one for recycling.
 - ***Please visit Appendix A for reference on the standards for "roll-out" bin placement on the streets, as it may impact the subdivision design.**

2. Maneuvering Standards for Collection Vehicles:

- Ensure that the turning radius for residential areas accommodates waste collection vehicles, allowing them to maneuver safely and efficiently within the community.
- Trucks involved in waste collection will require a turning radius of 45 feet to enter alleys or service drives for proper trash collection.
- The City of McAllen requires that trucks be able to exit streets or service drives by driving forward. If this is not feasible, the approach must be designed to minimize backing situations, with a maximum of 100 feet backing in a straight line allowed.
- A height clearance of 20 feet must be maintained, free of any obstructions, to allow for overhead collection by waste collection vehicles.
- Plan the street design to facilitate waste collection vehicle access to all townhome properties without causing congestion or hindering the overall traffic flow.
- Coordinate with waste management authorities to ensure that the road design and turning radius align with the specific requirements for waste collection vehicles as mandated by the City of McAllen.
- Corner clips may be required for townhome subdivisions where egress and ingress to alleyways can restrict turning radius of waste collection trucks.
- ***Please visit Appendix B for reference on the maneuvering standards, and Appendix E for reference on waste collection vehicles**

3. Cul-De-Sacs:

- If cul-de-sacs are present within the townhome community, design them to accommodate waste collection vehicles for efficient waste pickup.
- Design cul-de-sacs with a minimum outside paved radius of 50 feet to the face of curb to ensure that waste collection vehicles can navigate smoothly and collect waste from adjacent properties without difficulty.
- ***Please visit Appendix C for reference on the cul-de-sac details**

4. Submission of Plat to Planning Department (No Site Plan Required):

- Developers/engineers must submit the plat of the townhome construction project to the Planning Department for review and approval.
- A detailed plat indicating the layout of the townhome community, including the designated waste collection areas, dumpster easements, and access points, should be submitted for assessment.

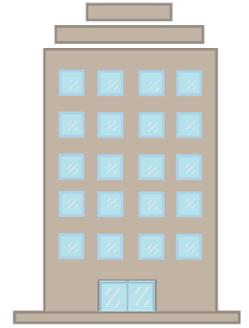

5. Route 98

- In developments where the City of McAllen water utility services are not present, the current owner of the property must set up a "Sanitation Only" Account with the City of McAllen. This service account must be set up with the Customer Relations department before final inspections can be approved.

[Back to Table of Contents](#)

Commercial

A building other than a residential building being developed for industrial or public purposes. Solid waste enclosures should be designed to hold all garbage and recyclables while being flexible to service a variety of tenants.

1. Alleys/Service Drives and Dumpster Enclosures:

- In all non-residential zoning districts, alleys/service drives are mandatory for waste collection purposes.
- In multi-family residential zoning districts, the Planning Director or designee may mandate service drives. These service drives must be at least 20 feet wide and constructed by the developer according to city plans and specifications.
- Compliance with the City of McAllen recycling program requires dual dumpster enclosures.

2. Dumpster Enclosure Details on Site Plan:

- The site plan must provide comprehensive details of dumpster enclosure designs, ensuring compliance with municipal standards and the City of McAllen's recycling program.
 - Dual enclosures are required, ensuring one green dumpster for solid waste and one blue dumpster for recycling
 - ***Please visit Appendix F for reference on the dumpster enclosure details**
- Enclosure details should be included on the site plan.

3. Maneuvering Standards for Collection Vehicles:

- Ensure that the turning radius for commercial areas accommodates waste collection vehicles, allowing them to maneuver safely and efficiently within the commercial development.
- Trucks involved in waste collection will require a turning radius of 45 feet to safely turn within the development for proper trash collection.
- The City of McAllen requires that trucks be able to exit streets or service drives by driving forward. If this is not feasible, the approach must be designed to minimize backing situations, with a maximum of 100 feet backing in a straight line allowed.
- A height clearance of 20 feet must be maintained, free of any obstructions, to allow for overhead collection by waste management vehicles.
- Plan the street design to facilitate waste collection vehicle access without causing congestion or hindering the overall traffic flow.
- Coordinate with waste management authorities to ensure that the road design and turning radius align with the specific requirements for waste collection vehicles as mandated by the City of McAllen.
- ***Please visit Appendix B for reference on the maneuvering standards, and Appendix E for reference on waste collection vehicles**

4. Space Requirements for Collection Vehicles:

- Developers must provide a minimum of 50 feet of unobstructed working space from the dumpster enclosure doors. This space ensures ease of access for waste collection vehicles to service the dumpsters effectively.
- ***Please visit Appendix F for reference on the unobstructed working space for collection vehicles**

5. Landscaping Considerations:

- Landscaping within the area of commercial dumpsters should not interfere with waste collection activities. Ensure that landscaping plans do not obstruct the collection process for commercial dumpsters.

6. Review Plat and Site Plan:

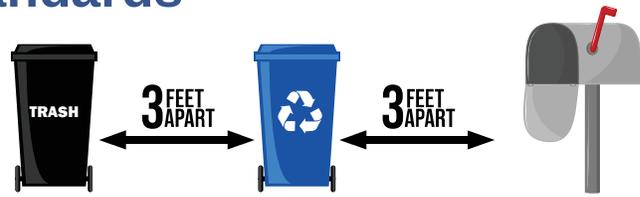

- The Planning Department will review the plat and site plan for compliance with waste management specifications.
- Service drive designs must be clearly depicted on the plat.
- The site plan should illustrate dumpster enclosure specifics and, if required, also on the plat.

7. Route 98

- In developments where the City of McAllen water utility services are not present, the current owner of the property must set up a "Sanitation Only" Account with the City of McAllen. This service account must be set up with the Customer Relations department before final inspections can be approved. [Back to Table of Contents](#)

Appendix A: Bin Placement Standards

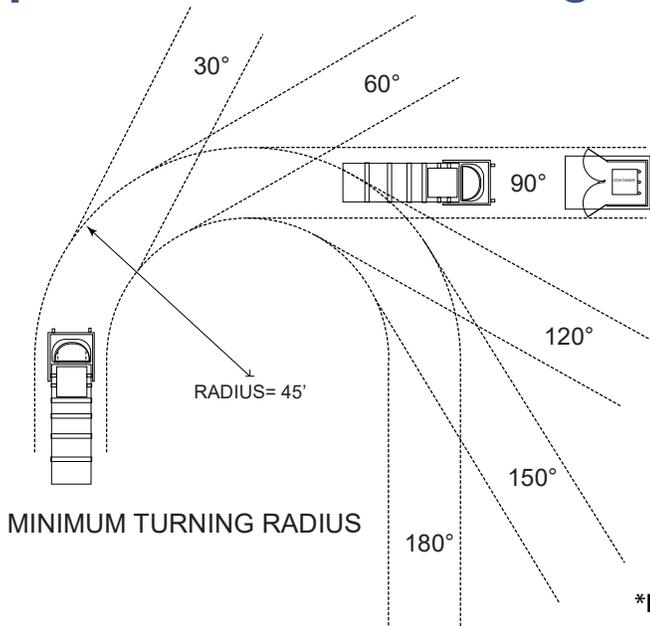

- Garbage collection needs black & blue bins 3 feet away from each other for an efficient pick up (residential areas – single family units and/or townhomes if applicable)

- Ensure that there are no obstructions around residential bins like mailboxes, cars or any shrubs/bushes behind them to prevent collision with solid waste collection vehicles.

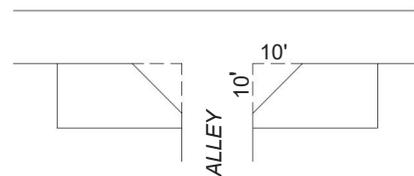

- At no time shall the containers be so placed that an alley or access to a mailbox will be blocked or obstructed, and all containers must be a minimum of three feet away from all objects and each other for service. Access is deemed to be obstructed whenever a container is placed within ten feet of a mailbox or within three feet of all other objects.

Appendix B: Maneuvering Standards

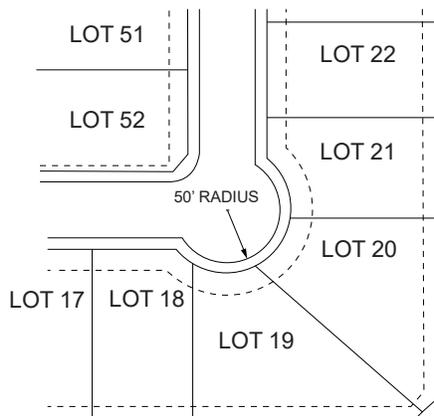

*Refer to Detail 406

- Trucks involved in waste collection will require a turning radius of 45 feet to enter alleys or service drives for proper trash collection.
- The City of McAllen recommends that trucks be able to exit streets or service drives by driving forward. If this is not feasible, the approach must be designed to minimize backing situations, with a maximum of 100 feet backing in a straight line allowed.
- A height clearance of 20 feet must be maintained, free of any obstructions, to allow for overhead collection by waste management vehicles.
- If the City of McAllen Public Works designee deems appropriate for proper maneuvering, a 10'x10' corner clip is required in alleyways/service drives where trash collection takes place.

Appendix C: Cul-De-Sac Standards

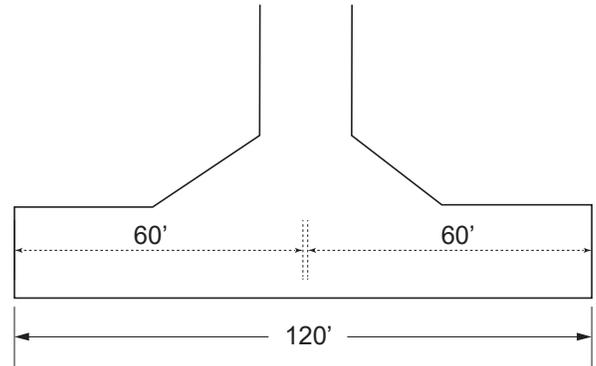

- If knuckle is present within the development, design them to accommodate waste collection vehicles for efficient waste pickup.
- Design knuckle with a minimum outside paved radius of 50 feet to the face of curb to ensure that waste collection vehicles can navigate smoothly and collect waste from adjacent properties without difficulty. Refer to Detail 209.
- No street parking on service dates.
- Deviations shall be submitted to the City Engineer for approval prior to construction.

[Back to Table of Contents](#)

Appendix D: Temporary Hammerhead Turn-Around

- Hammerhead Turn-Arounds may be placed in any development if deemed necessary
- Dimensions should allow 60 feet from the centerline of the street on each side to provide sufficient space for collection vehicle maneuvering. Thus totaling 120 feet in width as such:

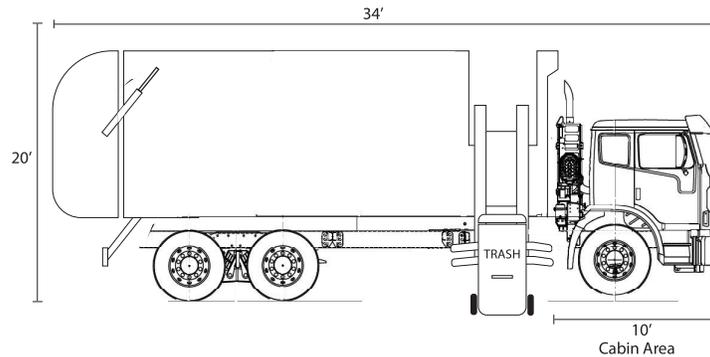

*Refer to Detail 211

Appendix E: Solid Waste Collection Vehicle Types

Residential Collection Trucks

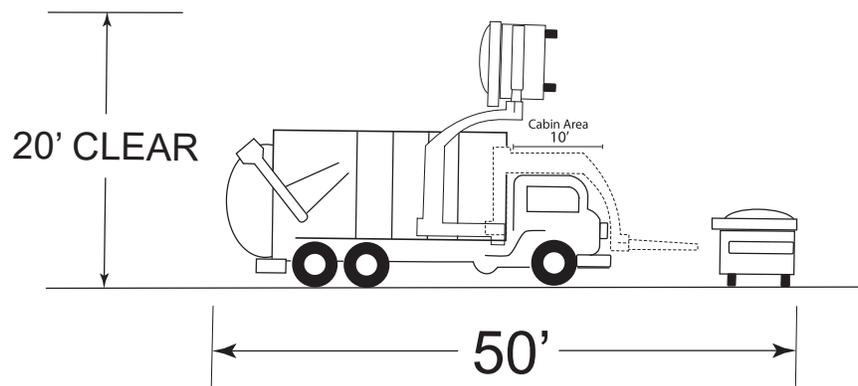

- USED IN TRASH COLLECTION FOR RESIDENTIAL DEVELOPMENTS THAT USE BLACK AND BLUE BINS ONLY.
 - APPLIES TO RESIDENTIAL SINGLE FAMILY OR TOWNHOME DEVELOPMENTS

Commercial Collection Trucks

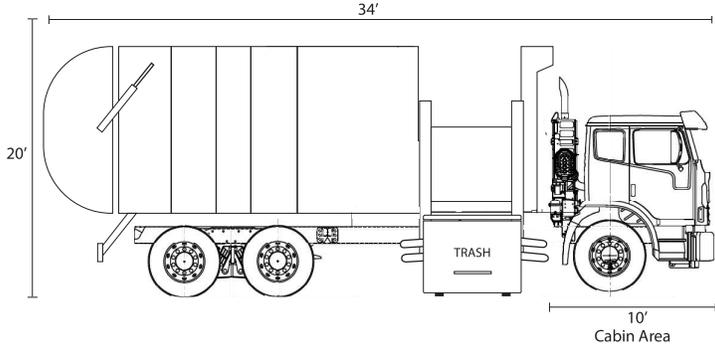

- USED IN TRASH COLLECTION FOR COMMERCIAL DEVELOPMENTS THAT USE GREEN BIN CONTAINERS
 - APPLIES TO TOWNHOMES, COMMERCIAL, OR MULTIFAMILY DEVELOPMENTS
- REQUIRE 50FT OF UNOBSTRUCTED WORKING AREA TO SERVICE DUMPSTERS SAFELY

Front-Load / Overhead Commercial Truck

[Back to Table of Contents](#)

Side-Load Commercial Truck

Appendix F: Dumpster Enclosure Details

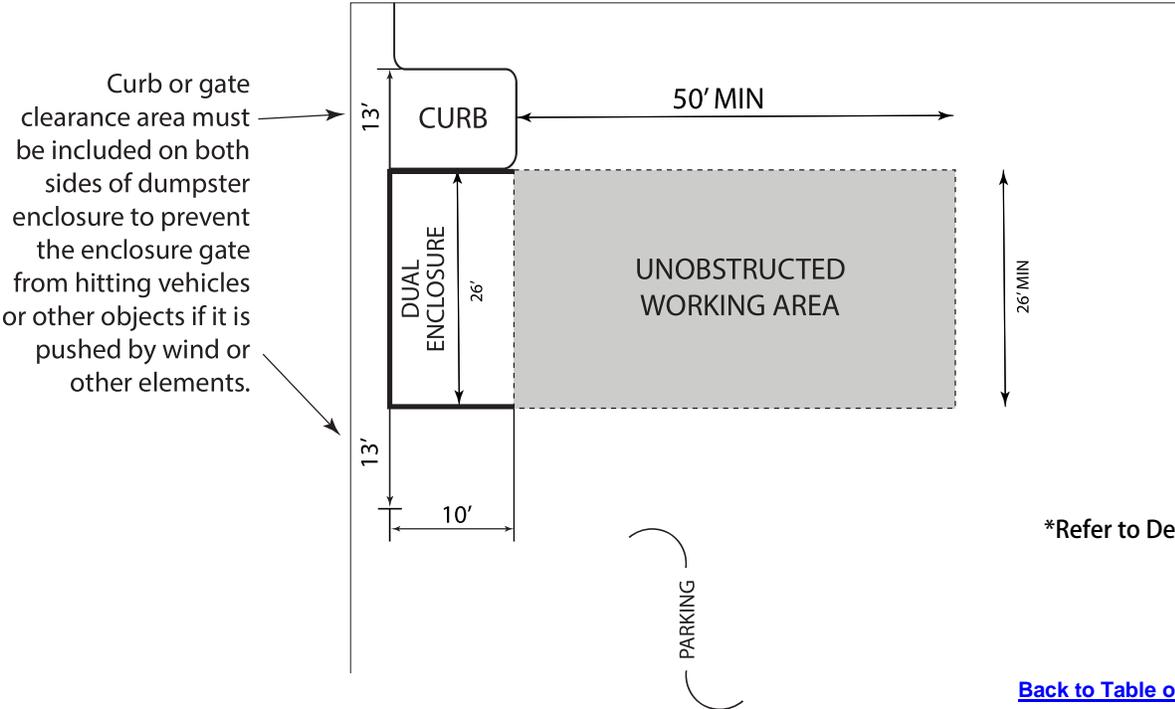

For any city developments mandating a dumpster enclosure, a dual dumpster enclosure (Detail 402) is required to demonstrate participation in the City of McAllen’s recycling program. The dual enclosure shall consist of a green dumpster designated for solid waste and a blue dumpster intended for recyclables.

In the event that a third additional dumpster is requested for the development, dimensions for a single dumpster enclosure (Detail 401) are provided as a reference.

It is permissible to construct both single and dual enclosures jointly, allowing flexibility in accommodating the specific waste disposal needs of the development.

All dumpster enclosures must have an unobstructed working area of 50 feet for collection vehicles to have safe, efficient access to service as depicted by the illustration below:

Dumpster Enclosure Unobstructed Working Area

[Back to Table of Contents](#)

TRAFFIC IMPACT ANALYSIS POLICY

TIA Requirements

The Traffic Impact Analysis (TIA) policy applies to new development, changes to existing development, and conditional use permits. The TIA shall assist City of McAllen staff in assessing the roadway system's ability to serve the development.

It shall be the responsibility of the developer and shall be submitted with plat/site plan and conditional use permit applications. The TIA will be used by City of McAllen staff to:

- Evaluate site access and traffic circulation
- Evaluate the ability of the roadway system to support the proposed development
- Determine specific on-site and off-site roadway system mitigation requirements
- Determine the developer's share of future roadway improvements

All Traffic Impact Analyses performed under this policy shall be conducted under the direction of a registered/licensed professional engineer. The final report shall be signed and sealed by the registered professional engineer responsible for the document. The Professional Engineer's license shall be valid in the State of Texas. Engineers performing the study shall discuss study requirements (trip generation, trip distribution, growth rates, e.g.) with the City of McAllen Engineering Department's designated staff to confirm each of these elements prior to completing the study.

1. TIA Scope

The scope of the Traffic Impact Analysis shall be based on the peak hours trips projected to be generated by the proposed development, as set for in the following table.

Nonresidential Peak Hour Trips	Residential Peak Hour Trips	TIA Scope
100 or less	100 or less	*Trip Generation Worksheet Required. No TIA Required.
101-300	101-300	The frontage of the property, all access points (including common access), and all intersections within a 1/4 mile radius of the proposed development.
301-500	301-500	The frontage of the property, all access points (including common access), and all intersections within a 1/2 mile radius of the proposed development.
501 or more	501 or more	The frontage of the property, all access points (including common access), and all intersections within a 1 mile radius of the proposed development.
* If no TIA is required then intersection sight triangles to be submitted for all intersections.		

2. Trip Generation

Trip generation shall be based on the specific site use and calculated using the latest addition of the Institute of Transportation Engineers (ITE) *Trip Generation Manual*.

3. Trip Distribution

Trip distribution shall be based on current peak hour traffic movements and may be adjusted to reflect future, financially assured, roadway improvements.

4. Study Time Frames

The analysis should include the following conditions:

- Existing traffic volumes and roadway conditions
- Existing traffic volumes and roadway conditions plus projected site generated traffic
- Existing traffic volumes with improved roadway conditions plus projected site generated traffic (when specified by City of McAllen staff)

The analysis should be performed for a typical week day unless specified by City of McAllen staff. The analysis shall include both the AM and PM peak hours, 24-hour generations, and special times or days of the week dependent of the land use's peak traffic generating time periods as determined from the *Trip Generation Manual*.

5. Access Analysis

Intersection needs at all the development's access points shall be determined. Spacing of the access points shall be determined both by the City of McAllen's 'Access Management Policy' and the operational analysis. This operational evaluation shall include on-site circulation as it may affect access, on-site and off-site turn lanes, required storage, potential for signalization, review of sight distance and other intersection safety aspects. Site distance triangles shall be shown on the site plan/plat and calculated using the latest addition of the *American Association of State Highway and Transportation Officials, "A Policy on Geometric Design of Highways and Streets" (Green Book)*. Usage of common access driveways is encouraged to reduce the total number of connections to the roadway network.

6. Level of Service Evaluation

Both roadway capacity and intersection capacity shall be evaluated as part of the level of service analysis. The level of service evaluation for roadways shall be based on the latest edition of *The Highway Capacity Manual (HCM)*. The volume to capacity ratio (v/c) is an important indicator of roadway capacity and shall be included as part of the level of service tables. Intersection level of service shall be calculated using the latest *Intersection Capacity Utilization (ICU)* methodologies. The intersection level of service tables shall include volume to capacity ratios (v/c) as well as volume to saturated flow ratios (v/s).

7. Recommendations

Recommendations shall be put forth to preserve existing roadway network operations. The recommendation may include the following incremental improvements:

- Left turn bays
- Increased storage lanes
- Right turn declaration lanes
- Conversion of Two-way Stop control to All-way Stop control, if warrants are met and staff approves
- Conversion of All-way Stop control to roundabout or traffic signal, if warrants are met and staff approves
- The installation of a traffic signal, if warrants are met and staff approves
- Improved signal timing or phasing
- Roadway expansion or extension
- Various access management measures to improve overall circulation and/or safety

Any suggested changes to signal timing must evaluate the effects to the entire network of affected signals and not just the signalized intersections in question. Recommendations put forth to expand or extend roadways shall conform to the *Foresight McAllen* comprehensive plan.

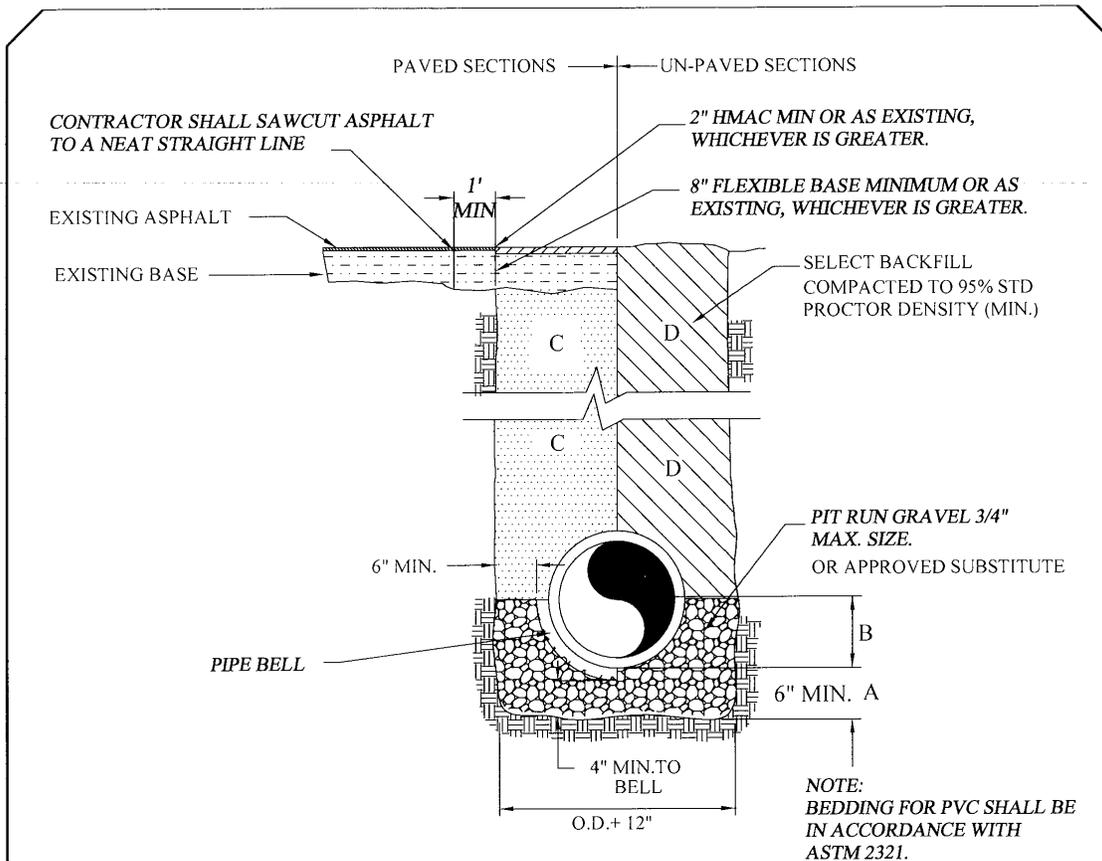

8. Mitigation

Mitigation may be required based on the TIA recommendations or to account for the cumulative effect of development on the roadway network. In the case of cumulative mitigation, fees may be charged proportionately to fund future roadway improvements.

Standard Details

Standard Details

GENERAL NOTES:

1. THE MINIMUM GATE WIDTH SHALL BE 20' FEET (6096MM) FOR NEW SUBDIVISIONS. FOR EXISTING SUBDIVISIONS, PROPOSED WIDTH MUST BE APPROVED BY FIRE DEPARTMENT.
2. GATES SHALL BE OF THE SWINGING TYPE.
3. CONSTRUCTION OF GATES SHALL BE OF MATERIALS THAT ALLOW MANUAL OPERATION BY ONE PERSON.
4. GATE COMPONENTS SHALL BE MAINTAINED IN AN OPERATIVE CONDITION AT ALL TIMES AND REPLACED OR REPAIRED WHEN DEFECTIVE.
5. ELECTRIC GATES SHALL BE EQUIPPED WITH A MEANS OF OPENING THE GATE BY FIRE DEPARTMENT PERSONNEL FOR EMERGENCY ACCESS. EMERGENCY OPENING DEVICES SHALL BE APPROVED BY THE CODE OFFICIAL.
6. MANUAL OPENING GATES SHALL NOT BE LOCKED WITH A PADLOCK OR CHAIN AND PADLOCK UNLESS THEY ARE CAPABLE OF BEING OPENED BY MEANS OF FORCIBLE ENTRY TOOLS MENU.
7. LOCKING DEVICE SPECIFICATIONS SHALL BE SUBMITTED FOR APPROVAL BY THE CODE OFFICIAL.

SECTION B-B

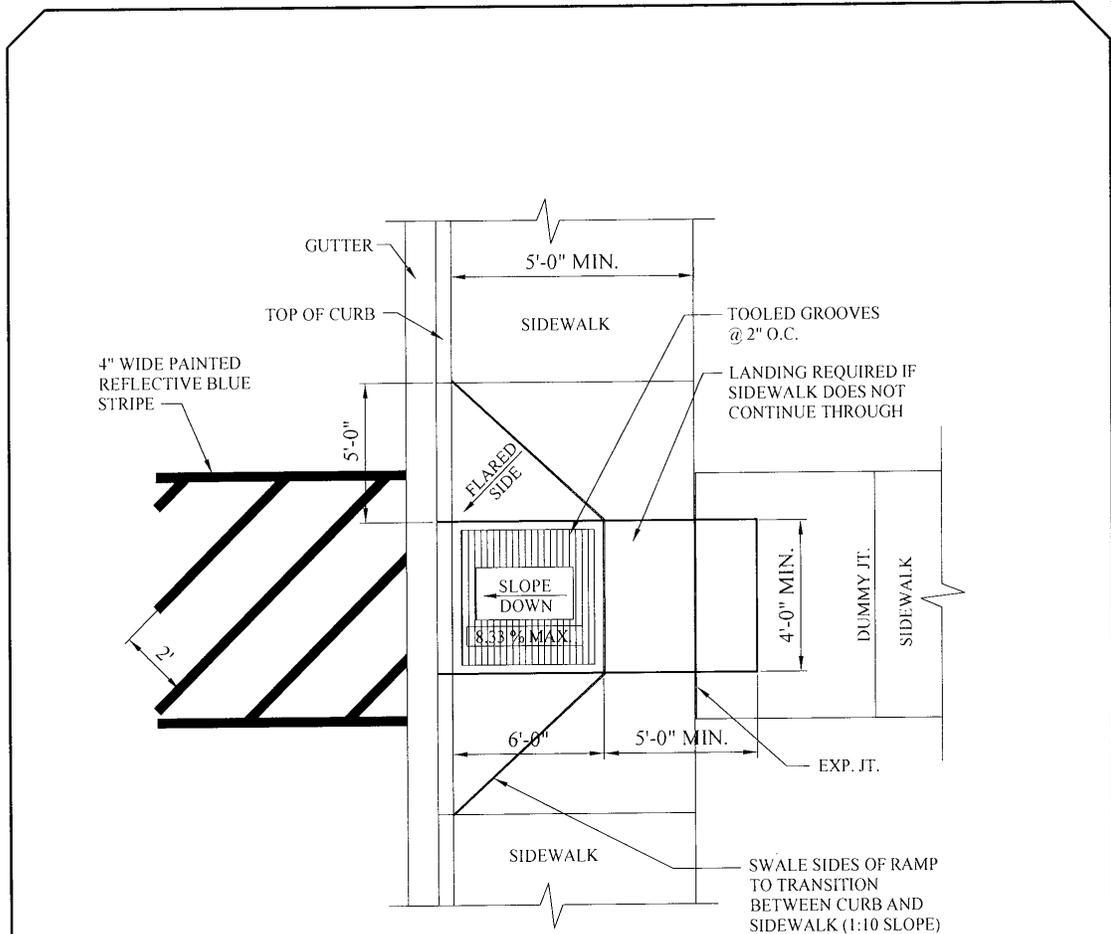

SURFACE TEXTURE

GENERAL NOTES:

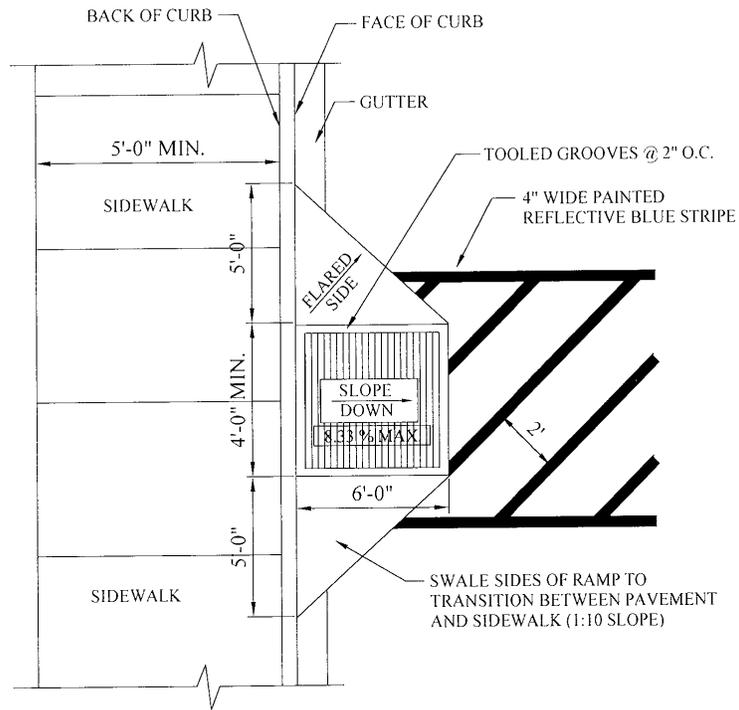

1. WHEELCHAIR RAMPS ARE TO BE LOCATED AT CROSSWALK AREAS AS DESIGNATED ON THE PLAN. ENGINEER CAN ADJUST LOCATIONS FOR SAFETY OR UTILITY CLEARANCE.
2. SURFACE TEXTURE OF WHEELCHAIR RAMP SHALL BE OBTAINED BY TOOL FINISH TRANSVERSE TO THE SLOPE OF THE RAMP.
3. SLOPES SHALL BE UNIFORM WITH NO ABRUPT CHANGES IN GRADES, NORMAL GUTTER LINE PROFILE SHOULD BE MAINTAINED THROUGH THE AREA OF THE RAMP.
4. WHEELCHAIR RAMPS SHALL BE MEASURED AND PAID AS CONCRETE SIDEWALK AND CONCRETE CURB AND GUTTER, AS APPLICABLE.
5. CONCRETE RAMP SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 3000 P.S.I. ALL CONCRETE WORK SHALL BE TREATED WITH MEMBRANE CURING COMPUND AFTER SURFACE TEXTURE HAS BEEN COMPLETED.
7. 6" X 6" No. 6 WIRE MESH SHALL BE USED FOR REINFORCING.
8. ALL RAMPS SHALL CONTRAST VISUALLY WITH ADJOINING SURFACES, DARK VERSUS LIGHT. THE MATERIAL USED TO PROVIDE THE CONTRAST SHALL BE AN INTEGRAL PART OF THE RAMP.

Standard Details

Standard Details

Standard Details

GENERAL NOTES:

1. FOR SLEEVE, USE GATES NO. 37 WATER HOSE, DISCHARGE HOSE OR EQUIVALENT WITH 6.625" I.D., 7.29" O.D, 6 PLY WITH A BLACK NEOPRENE COVER.
2. WELDS ARE TO BE GROUND SMOOTH.
3. EXPOSED STEEL AND SLEEVE TO BE PAINTED WITH OIL BASE ALKYD PRIMER AND OIL BASE ALKYD ENAMEL. TOP COAT COLOR TO BE BRIGHT YELLOW.
4. OF BOLLARD SHOULD BE WELL AWAY FROM TRAFFIC ON MAJOR ROADWAYS & PREFERABLY AT THE R-O-W LINE. TRAFFIC ENGINEER SHOULD BE CONSULTED ON LOCATION WHEN NEAR TRAFFIC.
5. PIPES ARE NOT TO BE FILLED WITH CONCRETE WHEN PIPES ARE LOCATED WITHIN 15' OF STREET FLOWLINE. USE WELDED STEEL CAP INSTEAD.

CONSTRUCTION NOTES

- A. 4" NOMINAL DIA. SCHEDULE 40 GALVANIZED STEEL PIPE, 5'-2" LONG. TO BE FILLED WITH CONCRETE PAINT PIPE BRIGHT YELLOW ABOVE FINISHED GRADE.
- B. PAVEMENT OR FINISHED GRADE.
- C. CONCRETE COLLAR 3000 P.S.I. AT 28 DAYS, WITH SMOOTH OR BROOM FINISH WHERE PAVEMENT IS ADJACENT.
- D. 5" NOMINAL DIA. SCHEDULE 40 GALVANIZED STEEL PIPE, 3'-0" LONG. TO BE FILLED WITH CONCRETE TO LEVEL SHOWN.
- E. 6" NOMINAL DIA. SCHEDULE 40 GALVANIZED STEEL PIPE, 2'-2" LONG. PAINT PIPE BRIGHT YELLOW. (REMOVABLE)
- F. 6" NOMINAL DIA. SCHEDULE 40 GALVANIZED 2'-0" LONG STEEL PIPE. (REMOVABLE)
- G. SLEEVE, 2'-2" LONG. PAINT BRIGHT YELLOW, SEE NOTE 1, THIS SHEET.
- H. 2" WIDE REFLECTIVE TAPE, AS APPROVED BY ENGINEER. LOCATE AROUND PIPE AS SHOWN.
- I. 1/4" THICK STEEL SAFETY GUARD BOX, OPEN ON ONE SIDE & BOTTOM. WELD ALL SEAMS.
- J. 3/4" X 8" GALVANIZED HEX. BOLT WITH A 3/8" DIA. HOLE FOR PADLOCK. (PADLOCK FURNISHED BY CITY).
- K. 1/4" X 6-5/8" DIA. GALVANIZED STEEL PLATE COVER, WELD TO PIPE.
- L. ALIGN WITH TRAFFIC FLOW IN EASEMENT OR BIKE PATH TO AVOID TRIPPING HAZARDS WITH BOX.

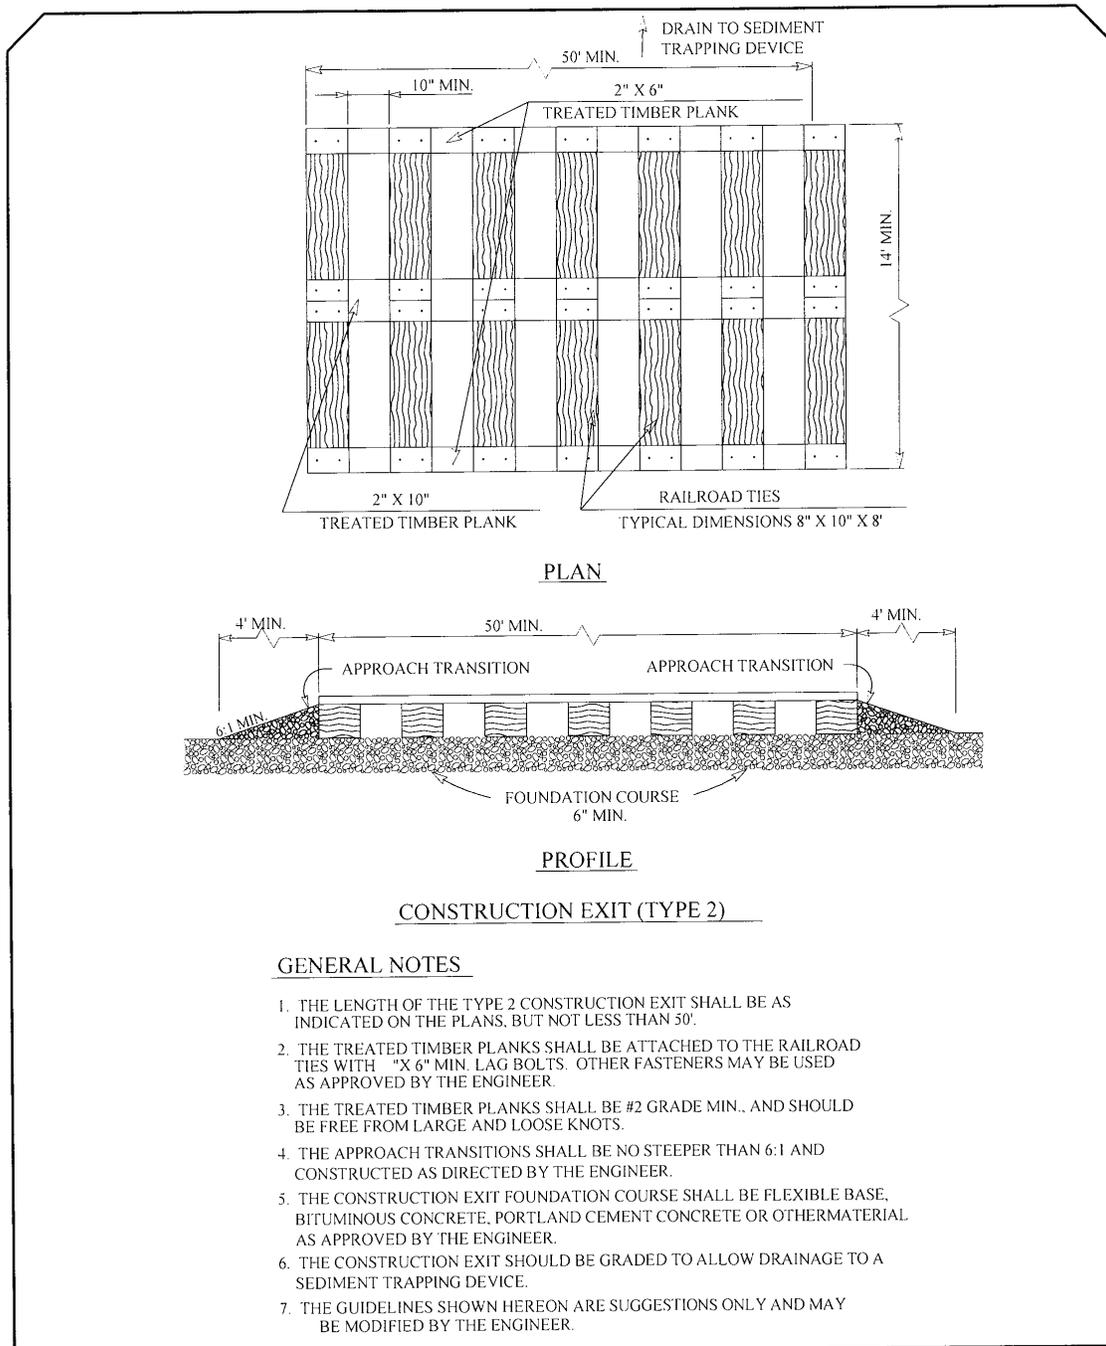

Standard Details

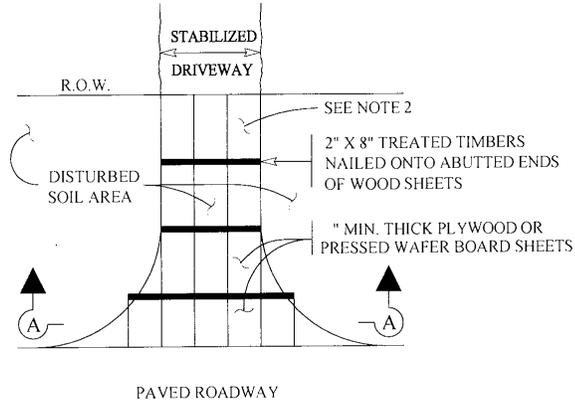

GENERAL NOTES

1. THE LENGTH OF THE TYPE 1 CONSTRUCTION EXIT SHALL BE AS INDICATED ON THE PLANS, BUT NOT LESS THAN 50'.
2. THE COARSE AGGREGATE SHOULD BE OPEN GRADED WITH A SIZE OF 4" TO 8".
3. THE APPROACH TRANSITIONS SHOULD BE NO STEEPER THAN 6:1 AND CONSTRUCTED AS DIRECTED BY THE ENGINEER.
4. THE CONSTRUCTION EXIT FOUNDATION COURSE SHALL BE FLEXIBLE BASE, BITUMINOUS CONCRETE, PORTLAND CEMENT CONCRETE OR OTHER MATERIAL AS APPROVED BY THE ENGINEER.
5. THE CONSTRUCTION EXIT SHALL BE GRADED TO ALLOW DRAINAGE TO A SEDIMENT TRAPPING DEVICE.
6. THE GUIDELINES SHOWN HEREON ARE SUGGESTIONS ONLY AND MAY BE MODIFIED BY THE ENGINEER.

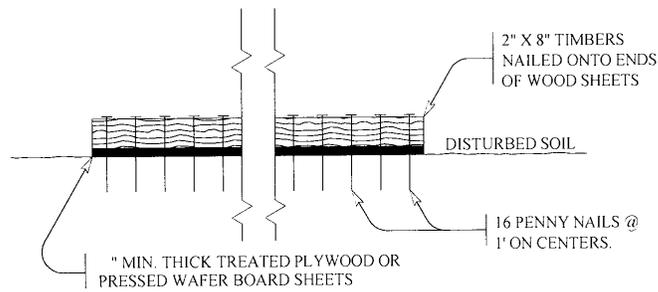

Standard Details

Standard Details

PLAN

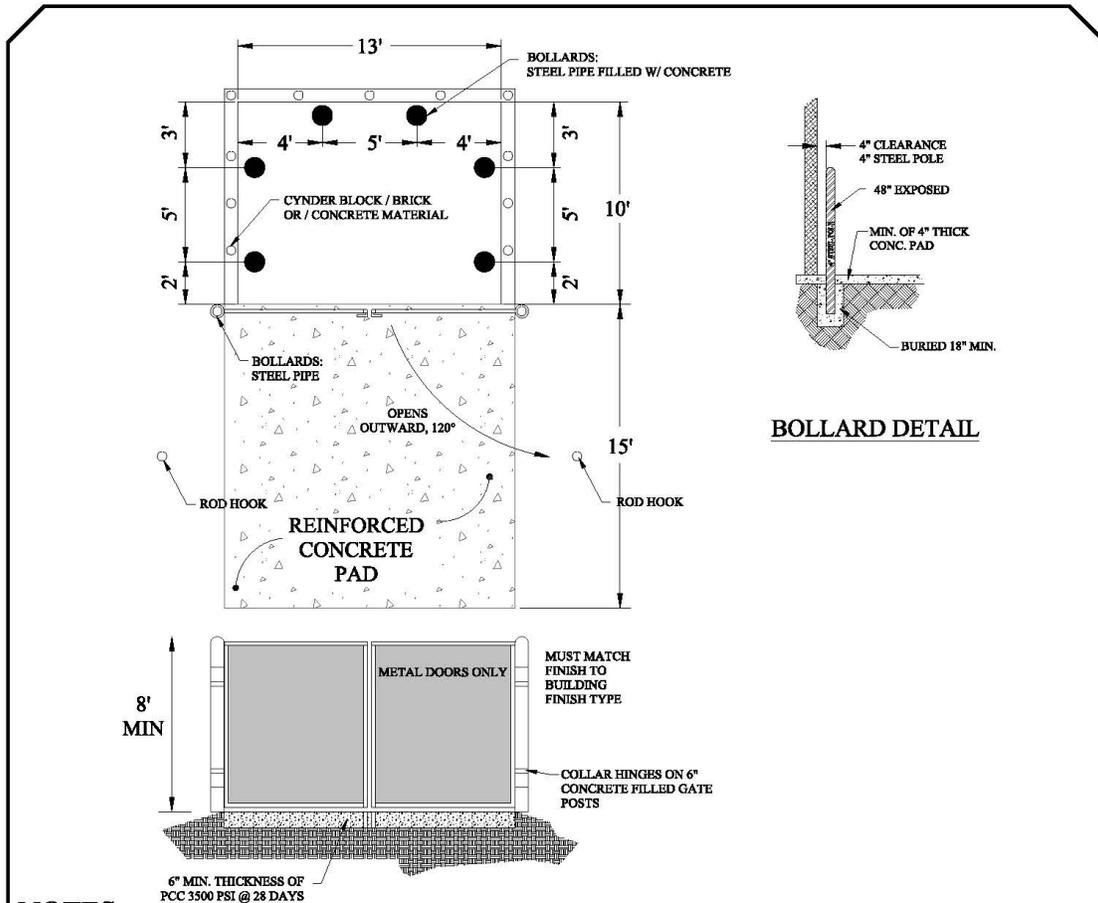

SECTION A-A

CONSTRUCTION EXIT (TYPE 3)

GENERAL NOTES

1. THE LENGTH OF THE TYPE 3 CONSTRUCTION EXIT SHALL BE AS SHOWN ON THE PLANS, OR AS DIRECTED BY THE ENGINEER.
2. THE TYPE 3 CONSTRUCTION EXIT MAY BE CONSTRUCTED FROM OPEN GRADED CRUSHED STONE WITH A SIZE OF TWO TO FOUR INCHES SPREAD A MIN. OF 4" THICK TO THE LIMITS SHOWN ON THE PLANS.
3. THE TREATED TIMBER PLANKS SHALL BE #2 GRADE MIN., AND SHOULD BE FREE FROM LARGE AND LOOSE KNOTS.
4. THE GUIDELINES SHOWN HEREON ARE SUGGESTIONS ONLY AND MAY BE MODIFIED BY THE ENGINEER.

Standard Details

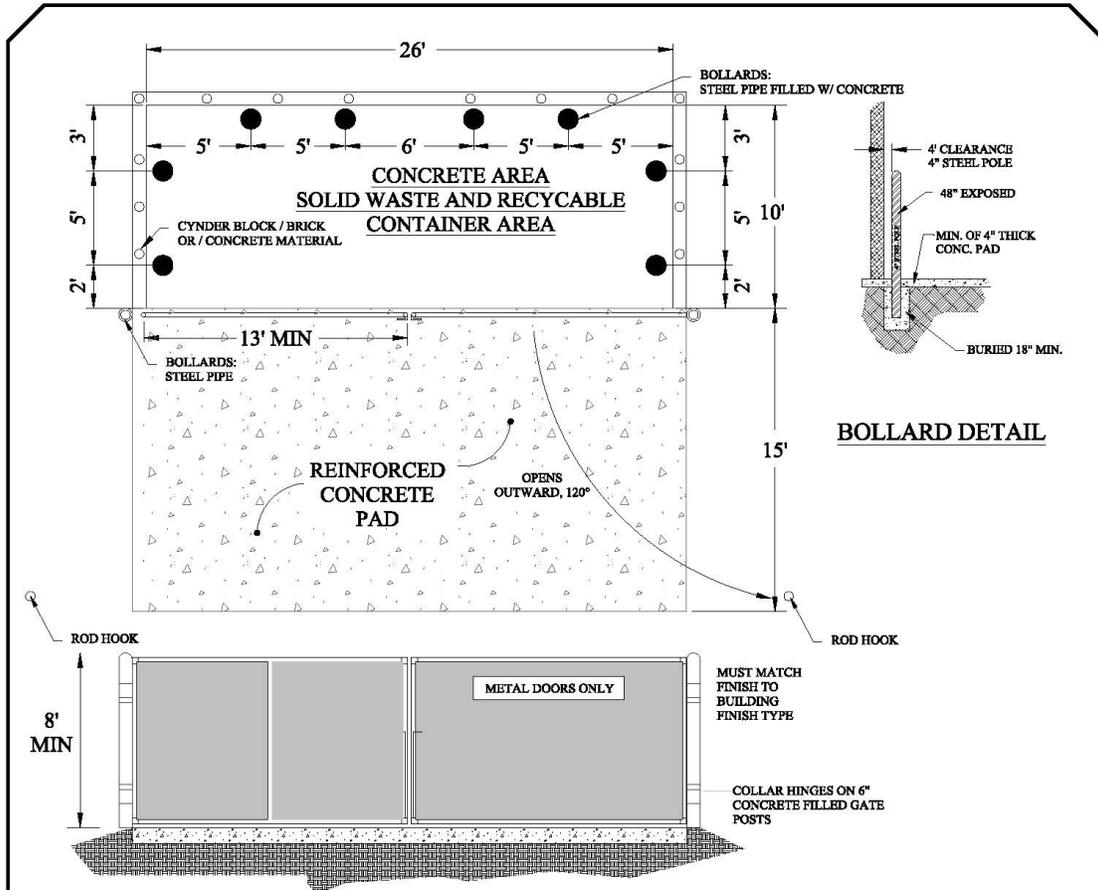

NOTES:

1. 8" THICK CONCRETE SLAB ON GRADE; 4000 P.S.I. CONCRETE WITH 6x6 #10 WELDED WIRE MESH OR 1/2" (#4 REBAR)
2. CONCRETE APRON SHOULD EXTEND OUT AN ADDITIONAL 15' IN FRONT OF DUMPSTER ENCLOSURE (SEE DETAIL)
3. BOLLARD PLACEMENT AND SIZE (SEE DETAIL)
4. TWO GATE DOORS FOR EACH 13'x10' DUMPSTER OPENING
5. 6" CONCRETE FILLED METAL GATE POSTS WITH COLLAR HINGES
6. GATE HOOKS TO BE INSTALLED ON EACH GATE DOOR. GATE HOOKS SHOULD MEASURE 3.6 FT LONG.
7. GATE HOOK HOLES TO BE POSITIONED AT 120 DEGREES FROM ITS CLOSED POSITION TO SECURE OPEN GATES. GATE HOOKS MUST BE AT LEAST 3 INCHES DEEP AND 3/4 INCHES WIDE.
8. ENCLOSURES MUST BE KEPT SECURE AT ALL TIMES. ANY REQUIRED REPAIRS OR IMPROVEMENTS MUST BE COMPLETED BY THE OWNER WITHIN 30 DAYS.
9. FOR CLARIFICATION OF ENCLOSURE ORIENTATION OR DIAGRAMS, CONTACT THE SOLID WASTE DIVISION AT 956-681-4020

Standard Details

[Back to Table of Contents](#)

Standard Details

[Back to Table of Contents](#)

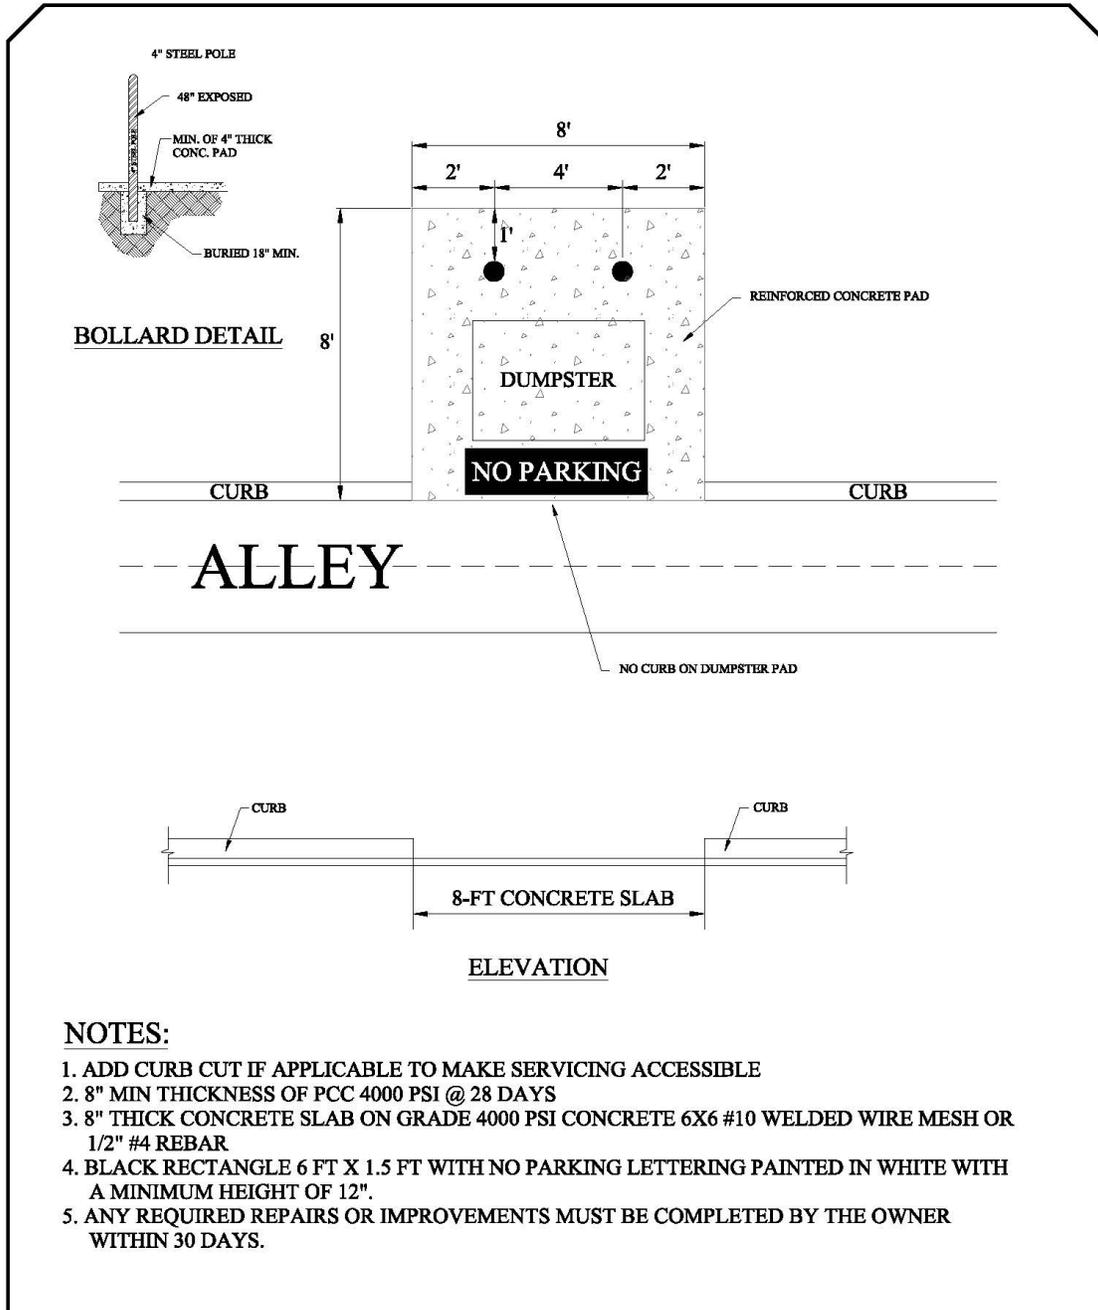

NOTES:

1. FOR ANY CITY DEVELOPMENTS MANDATING A DUMPSTER ENCLOSURE, A DUAL DUMPSTER ENCLOSURE (DETAIL 402) IS REQUIRED TO DEMONSTRATE PARTICIPATION IN THE CITY OF MCALLEN'S RECYCLING PROGRAM. THE DUAL ENCLOSURE SHALL CONSIST OF A GREEN DUMPSTER DESIGNATED FOR SOLID WASTE AND A BLUE DUMPSTER INTENDED FOR RECYCLABLES.
2. IN THE EVENT THAT A THIRD ADDITIONAL DUMPSTER IS REQUESTED FOR THE DEVELOPMENT, DIMENSIONS FOR A SINGLE DUMPSTER ENCLOSURE (DETAIL 401) ARE PROVIDED AS A REFERENCE.
3. IT IS PERMISSIBLE TO CONSTRUCT BOTH SINGLE AND DUAL ENCLOSURES JOINTLY, ALLOWING FLEXIBILITY IN ACCOMMODATING THE SPECIFIC WASTE DISPOSAL NEEDS OF THE DEVELOPMENT.
4. ALL DUMPSTER ENCLOSURES MUST HAVE AN UNOBSTRUCTED WORKING AREA OF 50 FEET FOR COLLECTION VEHICLES TO HAVE SAFE, EFFICIENT ACCESS TO SERVICE AS DEPICTED BY THE ILLUSTRATION IN DETAIL 405.

Standard Details

[Back to Table of Contents](#)

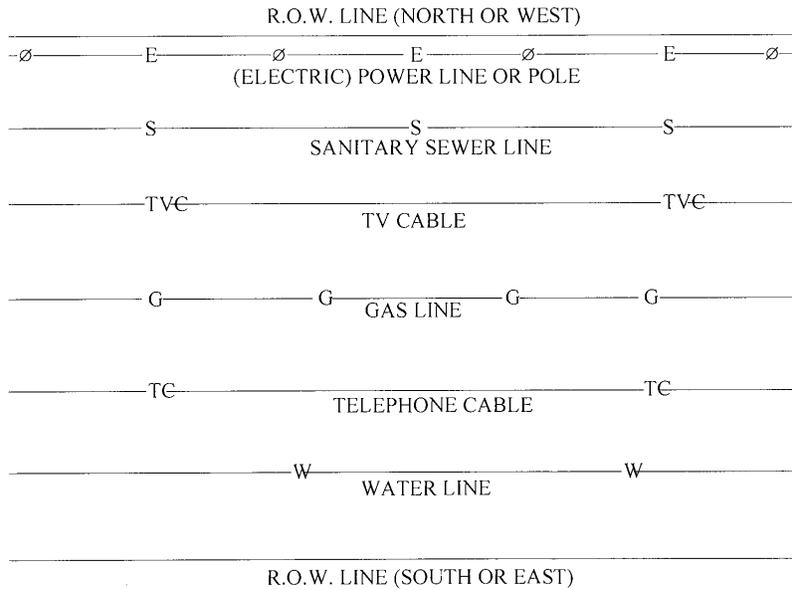

NOTES:

1. TRUCKS INVOLVED IN WASTE COLLECTION WILL REQUIRE A TURNING RADIUS OF 45 FEET TO ENTER ALLEYS OR SERVICE DRIVES FOR PROPER TRASH COLLECTION.
2. THE CITY OF McALLEN RECOMMENDS THAT TRUCKS BE ABLE TO EXIT STREETS OR SERVICE DRIVES BY DRIVING FORWARD. IF THIS IS NOT FEASIBLE, THE APPROACH MUST BE DESIGNED TO MINIMIZE BACKING SITUATIONS, WITH A MAXIMUM OF 100 FEET BACKING IN A STRAIGHT LINE ALLOWED.
3. A HEIGHT CLEARANCE OF 20 FEET MUST BE MAINTAINED, FREE OF ANY OBSTRUCTIONS, TO ALLOW FOR OVERHEAD COLLECTION BY WASTE MANAGEMENT VEHICLES.
4. IF THE CITY OF McALLEN PUBLIC WORKS DESIGNEE DEEMS APPROPRIATE FOR PROPER MANEUVERING, A 10'x10' CORNER CLIP IS REQUIRED IN ALLEYWAYS/SERVICE DRIVES WHERE TRASH COLLECTION TAKES PLACE.
5. REFER TO SOLID WASTE COLLECTION CONSTRUCTION GUIDELINES, APENDIX E, FOR REFERENCE ON WASTE COLLECTION VEHICLES.

Standard Details

GENERAL NOTES:

1. THE EXACT LOCATION OF THE EXISTING UTILITIES IS UNKNOWN. UTILITIES SHOULD BE LOCATED 48 HOURS PRIOR TO THE BEGINNING OF CONSTRUCTION, BY NOTIFYING THE UTILITY COMPANIES.
2. THE CONTRACTOR MAY PROCEED WITH CONSTRUCTION AFTER NOTIFICATIONS AND TAKING THE NECESSARY PRECAUTIONS AND IN ACCORDANCE WITH THE FOLLOWING DIAGRAM.
3. FIELD CONDITIONS MAY VARY, IN WHICH CASE IT WILL BE NECESSARY FOR THE PROJECT INSPECTOR TO DETERMINE ALIGNMENT OF UTILITY LINES.
